2774. Cirrhac \(\alpha\). Perianth spreading. Sepals free, equal. Petals linear, flexuose. Labellum unguiculate, continuous with the column, tripartite. Column erect, clavate, terete, with a nearly square horizontal stigma, and a
tendril beak. Anther dorsal, membravous, subunilocular. Pollen masses 2, parallel, oblong, compressed, with a short-horned caudicula, and an incurved gland.
2775. Sarcochilus. Perianth spreading. Lateral sepals connate with the claw of the labellum beneath. Petals conform to the sepals. Labellum spurless, continuous with the claw of the labellum, slippermshaped; middle lobe fleshy, solid. Pollen masses 2, sessile on a deltoid gland.
+1892. Maxilldria, page 749.
+1891. Xylobium, page 749.
2776. Biffenària. Sepals spreading, free, nearly equal. Lateral one adnate to the produced base at the column. Petals about half the size of the sepals. Labellum articulated to the mucronate base of the column, cucullate, 3-lobed, callous in the middle. Column short, semiterete, mutic. Anther mutic, somewhat crested. Pollen masses 4, incumbent, with two distinct caudiculæ.
2777. Trigonidium. Sepals equal, cohering into the form of a trigonal cup, spreading at the top. Petals about half the size of the sepals, veiny. Labellum short, 3-lobed, articulated with the column, fleshy in the middle. Column short, free, semiterete. Anther 1 -celled. Pollen masses 4, cohering. (No species given.)
2778. Trichopilia. Sepals and petals equal, spreading, narrow. Labellum large, petaloid, convolute, paralle! with the column, 3-lobed. Column terete, clavate. Anther 1-celled, compressed, convex in front. Pollen masses 2, adhering to a slender cuneate caudicula. Gland small.
2779. Dicrýpta. Sepals free, erect, equal. Petals conform to the sepals, but smatler. Labeilum 3-lobed, fleshy, articulated with the column. Column continuous with the ovarium, semiterete, clavate in front at the base. Anther obsoletely bilocular. Pollen masses 4, flattened, incumbent, with a short linear caudicula, and a binate gland.
2780. Govènia. Perianth bilabiate. Lateral sepals falcate. Petals conniving under the upper sepal, Labellum quite entire, spurless, concave, articulated with the column, sessile. Column terete, margined on both sides at the apex, drawn out a little at the base. Anther hood-formed, 1 -celled. Pollen masses 4, solid, incumbent, with a short caudicula, and a small triangular gland.
2781. Batemannia. Flower ringent, Sepals spreading, lateral ones unguiculate. Petals broader than sepals, oblique at base, adnate to the produced base of the column. Labellum articulate to the column, 3-lobed, cucullate. Column semiterete. Anthers small, 2-celled, membranous. Pollen masses 2,2 -lobed behind, with a triangular gland and no caudicula.
2782. Cycnoches. Perianth spreading. Lateral sepals lanceolate, upper one narrow. Petals broader than sepals, falcate. Labellum free, spurless, lanceolate, quite entire, continuous with the column, with an abrupt callous claw, Column elongated, arched, clavate at apex, furnished with two falcate auricles. Anther 2-celled. Pollen masses 2, furrowed, with a linear caudicula and a thick gland.
2783. Mýnthus. Perianth flattened. Sepals free, equal, similar to the petals, but narrower, Labellum flat, obovate, tridentate, shorter than the sepals. Column erect, terete, bicirrhose at the base. Anther and pollen masses as in Catasètum.
+1889. Catasètum, page 749 .
2784. Monachänthus. Perianth flattened. Sepals and petals equal, turned backwards. Labellum fleshy, undivided, ventricose, much larger than the sepals. Column short, thick, mutic. Anther and pollen masses as in Catasètum.
2785. Mormòdes. Upper sepal a little arched, narrow, lateral ones reflexed. Petals broader than the sepals, erect. Labellum ascending, 3-lobed, cuneated, apiculated, articulated with the column. Column semiterete, mutic. Pollen masses 4, connate by pairs, fixed to thick caudicula, and adhering to thick fleshy gland.
2786. Stanhòpea. Perianth membran., spreading, or reflexed. Sepals free, subundulated. Petals narrower than sepals. Labellum free, spurless, fleshy, and horned on both sides. Column very long, marginate. Anther 2 -celled. Pollen masses 2, elongated, cleft, caudicula shorter than the 2-lobed gland.
2787. Gongdra. Perianth flattened, Lateral sepals free, upper one connate to the back of the column. Petals smaller, adnate to the middle of the column. Labellum continuous with the base of the column, free, unguiculate Column very long, arched, clavate, marginate. Anthers subbilocular. Pollen masses 2, linear, sessile on a cuneated caudicula.
2788. Coryánthes. Perianth spreading. Sepals dilated, flexuose, conduplicate. Petals erect, much smaller than the sepals. Labellum large, unguiculate, galeate, continuous with the base of the column, 3 -dentate. Column terete, 2 -horned at the base, elongated, recurved at apex, 2-winged. Anther 2-celled. Pollen masses 2, compressed, sulcate behind, with a linear arched caudicula and a lunate gland.
2789. Angulda. Perianth globose. Sepals and petals free, concave, nearly equal. Labellum unguiculate, cucullate, 2 -lobed, with an intermediate reflexed segment. Column semiterete, clavate, 2 -horned at apex. Anther beaked. Pollen masses 2, with a lanceolate caudicula and small ovate gland. (No species given.)
2790. Peristeria. Perianth globose. Sepals somewhat connate with the base of the labellum. Petals smaller than the sepals. Labellum erect, articulated in the middle. Column erect, semiterete, dilated at the base. Arther crestless, 2-celled. Pollen masses 2, cleft behind. Gland sessile, naked, involving the beak.
1885. Cymbidium, Dage 749.
11901. Camaridium, page 749.
2791. Grobya. Perianth flattened, bilabiate. Lateral sepals connate at the base. Upper sepal erect, shorter. Petals dilated, erect, connivent, much larger than the sepals. Labellum 3-lobed, naked, articulated with the base of the column, smaller than the sepals. Column erect, semiterete, arched, thickened at the base. Pollen masses 2lobed behind, adnate to two short caudiculæ. Gland oval.
2792. Acropèra. Sepals spreading, upper one galeate, lateral ones divaricated. Petals short, oblique, truncate at apex. Labellum unguiculate, articulate at the base of the column, 3 -lobed; the middle lobe smaller and saccate. Column erect, marginate, saccate at the base. Pollen masses 2, linear, convolute, with a linear subulate caudicula and a minute gland. Beak subulate.
2793. Granmatophýllum. Perianth flattened, spreading. Sepals and petals nearly equal. Labellum articulate with the column, short, 3-lobed, cucullate. Column arched, erect, semiterete, callous at the base. Anthers subbilocular. Pollen masses 2, globose, sulcate at the base, sessile upon the extremity of an arched gland.
+1888. Geodдrum, page 749.
2794. Sobrifia. Perianth large, rather fleshy, flattened, spreading. Sepals and petals nearly equal. Labellum cucullate, involving the column, narrowed at the base, 2 -lobed. Column erect, elongated, marginate, clavate, winged on both sides at the apex. Anther 2-celled. Pollen masses 2, with a linear caudicula.
2795. Acanthophippıum. Perianth ventricose. Sepals agglutinate. Lateral sepals adnate to the claw of the column. Labellum unguiculate, articulate with the base of the column, 3-lobed, complicate, with a lamellate disk. Anther fleshy, 2 -celled. Pollen masses 8 , unequal, sessile.
+1929- Calypso, page 750.
+1920. Eulophia, page 759.
2796. Dipodium. Perianth spreading. Petals and sepals equal. Labellum auricled on both sides beneath the middle, bearded in the disk, saccate at the base, and connate with the column. Column erect, marginate, semiterete. Anther membranous, 2-celled. Pollen masses 2, obliquely 2-lobed, fixed to two caudiculæ.
2797. Galeándra. Perianth spreading or connivent. Sepals and petals ascending, free. Labellum funnel-shaped, spurred, undivided, sessile, sometimes fringed on the margin. Column erect, winged. Anther helmet-shaped, with a recurved crest. Pollen masses ?, excavated behind, with a short caudicula and elongated gland.
2798. Zygopétalum. Perianth flattened. Sepals and petals ascending, nearly equal, connate with the claw of column. Labellum mutic, undivided, spreading, with an ascending claw and large transverse fleshy crest. Column short, arched, semiterete. Anther subbiiocular. Pollen masses 2, almost sessile on a transverse gland.
2799. Huntleya. Perianth flattened, nearly equal. Lateral sepals involute at the base in front. Labellum flat, unguiculate, spreading, rhomboid, fringed at the base, articulated with the base of the column. Column clavate, cucullate at apex, winged in the margin. Anther 2 -celled, mutic. Pollen masses 4.
2800. Stenia. Perianth flattened, nearly equal. Lateral sepals oblique at the base, Labellum continuous with
the base of the column, concave, appendiculated in the disk. Column semiterete, drawn out at the base, rounded at the apex, mutic. Anther 2-celled. Pollen masses 4, linear, twin; dorsal one small. Caudicula nearly square, acute.
+1896. Cyriopodium, page 749.
2801. Cyrtopera. Perianth flattened. Sepals and petals ascending, nearly equal, connate with the claw of the column. Labellum spurless, concave, 3 -lobed, with callous crested or tubercled veins. Column semiterete, marginate. Anther 1-2-celled. Polleu masses 2, 2-lobed behind, with a short subtriangular caudicula.
1887. Lissochilus, page 749.
11893. Notylia, page 749.
2802. Masdevállia. Perianth closed. Sepals acuminate, or awned, connate into a campanulate tube. Petals short. Labellum short, oblong, concave, entire, articulated with the column. Column erect, linear, channelled. Pollen masses 2, with a short caudicula.
2803. Cryptochilus. Perjanth tubular, contracted at the throat, gibbous in front at the base. Sepals connate, except at the apex. Petals free, rather smaller than the sepal. Labellum undivided, free, continuous to the base of the column. Column semiterete. Anther 2 -celled. Pollen masses 8 , adhering by pairs to common glands.
11919. Ionúpsis, page 751.
2804. Quekéttia. Perianth cylindrical. Sepals linear, equal, gibbous at the base; lateral ones connate. Petals linear, of equal length. Labellum oblong, entire, mutic, parallel with the column, excavated at the base, bicallose. Column semiterete, erect, auricled on both sides at the apex. Anther 1-celled. Pollen masses 2, excavated behind; with a linear candicula and a minute gland.
+1883. Rodriguèzia, page 749.
+1884. Gomiza, page 749.
2805. Burlingtonia. Perianth membranous, convolute, oblique. Sepals unguiculate, shorter than the labellum; lateral ones concave at the base, connate. Petals unguiculate, parallel with the labellum. Labellum 2-lobed parallel with the column, with \(a\) channelled lamellate claw. Column terete, clavate. Stigma horned on both sides. Anther 1-celled. Pollen masses 2, excavated behind, adnate to a subulate elastic caudicula.
2806. Comparéttia. Perianth ringent. Middle sepal and petal short, free, somewhat galeate; lateral ones connate, one-spurred. Labellum free, fattened, obcordate, unguiculate, furnished with 2 spurs, which are hidden within the spur of the sepals. Column free, erect, mutic. Pollen masses 2, adnate to beaked cuneated caudicula.
+1898. Macradenia, page 749.
1909. Cryptarrhèna, page 749.
11895. Oncidium, page 749.
2807. Fernandezia. Perianth spreading. Sepals free. Petals conniving under the upper sepal. Labellum spurless, free, 3 -lobed, tubercled on the disk. Column short, eared on both sides. Anther 2-celled. Pollen masses 2, obovate, 2808. Scaphyglottis. Sepals connivent. Lateral ones drawn out at the base, a little connate with the foot of the column, upper one linear, convex. Petals a little shorter than the sepals. Labellum oblong, channelled, continuous with the column, with a repand margin. Column marginate. Pollen masses 4, sessile on a cuneated gland.
2809. Pachyphýllum. Perianth connivent. Sepals and petals free, equally acute. Labellum free, undivided, sessile, furnished with one tubercle at the base, and two at the apex. Column petaloid. Pollen masses 2. (No species given.)
2810. Dicha'a. Perianth connivent. Sepals and petals free, acute, equal. Labellum unguiculate, naked, spurless, deltoid, articulated with the column. Column erect, terete, wingless. Anther 2 -celled. Pollen masses 4 , by pairs, collateral, with a cuneate caudicula and a minute gland.
2811. Miltdnia. Perianth flattened. Petals revolute, and lateral sepals connate at the base, sessile. Labellum large, dilated, undivided, sessile, connate with the column, lamellate at the base. Column short, semiterete, eared at the apex. Pollen masses 2, adnate to an oblong caudicula.
2812. Cyrtochilum. Perianth flattened. Sepals free, lateral ones unguiculate. Petals a little smaller than sepals. Labellum free, undivided, continuous to the base of the column, with a tuberculated claw. Column short winged. Anther 2-celled. Pollen masses 2, with a filiform caudicula and a minute gland.
+1886. Brássia, page 749.
2813. Tetrapéltis. Perianth somewhat spreading. Sepals free, equal. Petals very narrow, of equal length. Labellum free, sessile, saccate, geniculate, 3 -lobed. Column erect, length of petals semiterete, clavate. Rostellum straight. Pollen masses 4, globuse, pitted behind, adhering by pairs to two narrow caudiculæ connected by a common gland.
2814. Phalanopsis. Perianth flattened, spreading. Sepals free. Petals larger than the sepals, dilated. Labellum connate with the column, free, 3 -lobed, callous at the base; middle lobe narrower, bicirrhose. Column lying upon the ovarium, semiterete. Rostellum gladiate. Anther 2 -celled. Pollen masses 2 , nearly globose, with a flat spatulate caudicula and a large caudate gland.
†1916. Vánda, page 750.
2815. Camarotis. Perianth flattened. Lateral sepals connate with the back of the labellum, free at apex. Petals a little smaller than the sepals, free. Labellum obovate, channelled, appendiculate at apex. Column erect, terete, free, beaked. Anther dorsal, apiculate, subbilocular. Pollen masses 2, with a very long subulate caudicula and a forked rostellum.
†1918. Renanthèra, page 750.
2816. Mioropèra. Perianth equal, spreading. Lateral sepals adnate to the base of the labellum. Labellum continuous with the base of the column, slipper-shaped, 3 -lobed ; middle lobe very small. Column short, with a large inflexed rostellum. Pollen masses 2, with a subulate caudicula.
2817. Saccolabium. Perianth flattened, spreading. Sepals equal to the petals, lateral ones usually largest. Labellum undivided, spurred, connate with the base of the column. Column erect, semiterete; with subulate rostellum. Anther semibilocular. Pollen masses 2, nearly globose, with an elongated caudicula and a minute gland.
2818. Clcisóstoma. Sepals and petals spreading, linear, nearly equal. Labellum spurred, connate with the base of the column, 3-dentate. Column semiterete. Anther semibilucular. Pollen masses 2, 2-lobed, nearly globose, with a filiform caudicula and a hooked minute gland. (No species given.)
+1915. Sarcánthus, page 750.
2819. Eceóclades. Perianth spreading, ringent, or connivent, nearly equal, free. Labellım free, sessile, articulate with the column, spurred, naked, or bilamellate at the base. Column elongated, semiterete. Anther 2-celled. Pollen masses 2, furrowed behind, with a narrow caudicula and a minute gland.
11917. Aérides, page 750.
1922. Aeránthes, page 750.
+1921. Angræ'cum, page 750
2820. Trichocentrum. Perianth spreading, free, equal. Labellum sessile, spurred, flat, 2-lobed, lamellose at the base, connate with the base of the column. Column short, semiterete, thick, winged on both sides. Anther 2-celled, mutic. Pollen masses 2, complicate, with a cuneated caudicula and a minute gland.
11923. Calánthe, page 750.
IV. Ophry'dez. - Pollen cohering in innumerable waxy masses, collected on a cobwebbed elastic axis, fixed to the glands of the stigma. Anther terminal, erect, or resupinate, persistent, with complete cells.
11859. O'rchis, page 748.

+1861. Habenària, page 748.
2821. Bonatea. Perianth and anther of Habenaria. Upper lip of stigma free, cucullated, or complicated ; piocesi of the stigma sometimes long and sometimes short.
2822. Cynórchis. Sepals equal, connivent. Petals fixed under the upper sepal. Labellum connate with the column, spurred, usually 4 -parted. Sepals larger than the petals, and of a different texture. Column short. Anther horizontal or resupinate, with distinct elongated cells. Rostellum flat, 3-partite. Pollen glands naked. Lobes of stigma 2 , fleshy.
+1862. Bartholina, page 748.
+1856. Satyrium, page 748.
+1855. Disa, page 748.
1862. Serappias, page 748.
2823. Pterygodium. Perianth subringent. Lateral sepals exterior, horizontal, concave. Labellum inserted in the middle of the column, between the remote cells of the anther.
2824. Cori/icium. Perianth ringent. Petals equal at the base, erect; lateral ones connate. Petals free, concave. Labellum unguiculate, connate with the face of the column, appendiculate in front. Anther dorsal, resupinate. Glands naked.
+1866 . O phrys, page 748.
2825. Dispèris. Perianth ringent, of 4-5 sepals. Lateral sepals exterior, horizontal, somewhat spurred. Labellum erect from the base of the column, and connected with it. Anther revolute, drawn out in two segments, which are bent in front.
V. Gastrodie es. - Anther terminal, opercular. Pollen masses cohering in granules, which finally become waxy, and are indefinite in number.
2826. Gastròdia. Perianth tubular, 5-lobed. Lobes secund. Labellum closed, free, unguiculate, lying on the column. Column long, hollow at top. Anther deciduous, with approximate cells. Pollen masses large, composed of numerous angular particles.
VI. Arethu`see, - Anther terminal, opercular. Pollen masses as in tribe Neottièæ.
\(\dagger\) 1881. Caleàna, page 749.
2827. Corysánthes. Perianth ringent. Helmet large. Lower lip 4 -parted, short, hidden by the labellum. Labellum large, cucullate, or tubular. Anther 1-celled, 2 -valved, persistent. Pollen masses 4, powdery.
2828. Pteróstylis. Perianth ringent, 4-leaved, inner leafet bifid. Labellum unguiculate, almost enclosed, appendiculate, or gibbous at the base. Column connate with the base of the galea, winged at apex. Anther persistent, with approximate cells. Pollen masses 2 in each, all compressed, powdery.
†1877. Arethüsa, page 749.
+1879. Pogдліа, page 749.
+1878. Calopògon, page 749.
2829. Glossodia. Yerianth of 5 equal spreading sepals. Labellum dissimilar, short, undivided, glandless. Appendage hetween the column and the labellum. Anther terminating the membranous dilated column, with approximate cells. Pollen masses 2 in each cell, compressed, powdery.
2830 Chlora'a. Perianth membranous. Outer sepals nearly equal; lateral ones deflexed ; upper one, along with the inner ones, conniving into a galea. Labellum sessile, cucullate, entire or 3-lobed, with a crested disk. Column elongated, semiterete, marginate. Anther 2-celled. Stigma lying on the top of the column. Pollen masses 2, bipartite, cohering behind.

2831. Caladenia. Perianth bilabiate, glandular outside. Upper lip fattish. Labellum unguiculate, cucullate, somewhat 3-lobed, or narrowed at the apex, ornamented with rows of glands in the disk. Column membranaceously dilated. Anther persistent, with approximate cells. Pollen masses 2 in each cell, compressed, half 2 -lobed, powdery.
2832. Eriochilus. Perianth bilabiate. Outer lateral sepals unguiculate; inner ones erect, smaller. Labellum unguiculate, inappendiculate, with a pubescent glandless disk. Column semiterete, simple at top. Anther persistent, mutic, with approximate cells. Pollen masses 4 in each cell.
2833. Chiloglottis. Perianth bilabiate. Outer lateral sepals channelled, and terete at the apex. Labellum unguiculate, glandular in the disk, and furnished with a tongue-shaped appendage at the base. Column bifid at apex. Anther persistent, with proximate cells. Pollen masses 2 in each cell, compressed, powdery.
2834. Cyrtosiylis. Perianth bilabiate. Sepals mutic, 4 lateral ones nearly equal, spreading. Labellum dissimilar, stretched out, lat, obtuse, undivided, bicallose at the base. Column semiterete, dilated at apex. Anther persistent, with approximate cells, Pollen masses as in Chiloglottis.
2835. Micrdtis. Perianth ringent. Outer lateral sepals sessile; inner ones almost similar, ascending. Labellum dissimilar, oblong, obtuse, callous at the base. Column funnel-shaped. Anther furnished with a membranous auricle on both sides. Yollen masses 2 in each cell, powdery, fixed by the base.
VII. Neotrisee. - Anther parallel with the stigma, and erect. Pollen masses simple, or consisting of granules in a loose state of cohesion.

2\＄44．Pterocàrya 18054 cauccisica．This tree is＂sufficiently hardy to be classed among ornamental trees of the third rank．It is readily propagated by layers．For small gardens and diminutive arboretums this tree may serve ver \(y\) well to exemplify the Juglandaceæ．Care should be taken to train it to a single stem，and not to plant it in soil so rich and moist as to prevent it from ripening its wood Perhaps something might be gained，in noint of hardiness by grafting it upon the common walnut．＂（Arb．Brit．，vol．iii．p．1452．）

Hisiory Use, Propagation, Cullure,
2845. Picea. "Some confusion exists in the works of modern authors respecting the silver fir and the spruce; partly, as it would appear, from the circumstance of Linnæus having made an erroneous application of the names given to these trees by Pliny. The tree which Theophrastus calls Elate, Pliny calls Abies, and Linmæus Pinus Picea; while the tree that Pliny calls Picea, and which is our spruce fir, is named by Linnæus Pinus \(A\) 'bies. The silver fir was esteemed by the Romans for its use in carpentry, and for the construction of vessels. . . . . . The wood of the silver fir is elastic, and the colour is whitish. The grain is irregular, as the fibres which compose it are partly white and tender, and partly yellow or fawn-coloured, and hard. The narrower the white lines are, the more beautiful and solid is the grain of the wood. In the Vosges, it is said that the external layers are more compact than the internal ones, which may arise from the practice of barking the trees there before they are cut down. The weight of this wood varies exceedingly, according to the age of the tree, the place where it grew, and even the part of the trunk from which it was taken. According to Hartig, the wood of a tree 80 years old weighs 661 bs .14 oz . per cubic foot green, and \(41 \mathrm{lbs}, 5 \mathrm{oz}\). when dry ; while that of a tree 40 years old weighs only \(37 \mathrm{lbs}, 9 \mathrm{oz}\), when dry. It shrinks considerably in drying, like all white woods. It is used for planks, and carpentry of all kinds, for the masts of small vessels, for joists and rafters, and for building the boats for navigating rivers. it is said to endure a long time when used as piles, and to be much enployed in Holland for that purpose. In the Vosges it is used in every department of agriculture, carpentry, joinery, and even cabinet-making and sculpture. In England, the wood of the silver fir has been chiefly used for Hooring; and, according to Arthur Young, and also to Mitchell, boards sawn out of full-grown trees

> and Miscellancous Particulars.
may be laid down at once, without any risk of their shrinking. As fuel, the wood of the silver fir is th that of the beech as 1079 is to \(\mathbf{5 4 0}\), and that of the spruce as 1079 is to 1211 . The charcoal is to that of the beech as 1127 is to 1600 . Though the charcoal is much inferior to that of the beech, yet it is preferred for heatiog iron that is to be forged, as producing the heat more slowly, in consequence of which the iron is more pliant to work. The bark may be employed for tanning leather, and is used generally in some parts of Switzerland. A resinous sap flows from the trunk and branches, called larmes de sapin. This sap is bitter, acrid, and viscous, and its smell approaches to that of the citron; it is healing, balsamic, and antiseptic. The resinous fluid is found in small tumours or blisters, under the epidermis of the bark, and in the green cones, from the latter of which it is collected about midsummer. From the resin of this tree are manufactured Strasburg turpentine (so called from a large forest of silver firs, the Hockwald, near Strasburg), colophony, and white pitch. The quantity of potash furnished by the bark and wood is in proportion of 2 lbs . of potash to 1000 lbs . of wood and bark, which places the silver fir in the rank of 21 in a series of 73 ligneous plants. In some parts of Europe, the young cones, reduced by boiling to a pulp, and preserved with sugar, are eaten as a sweetmeat. This conserve is put into tea, to which it is said to communicate an agreeable odour. The leaves serve for litter; and, in Switzerland, according to Kasthoffer, are given to sheep, and goats: but they are said to give the milk a peculiar taste."
"The silver fir, like all the other Abletinæ, will attain a large size on soils of a very opposite description ; but a loam, rather rich and deep than otherwise, appears to suit it best." (Arb. Brit., vol. iv.)

History, Lise, Propagation, Culture,
2846. Gärrya 18088 clliptica is an evergreen hardy shrub, with thick coriaceous leaves, like some species of evergreen viburnum. "This is probably the greatest botanical curiosity senthome by Douglas; for it appears to represent a natural order altogether distinct from any previously known, and connecting certain well-known natural orders in an unexpected and satisfactory manner. In its amentaceous inforescefe, mostentially in its wood without mode of germination, Garrya is very siminar to Cupulferx, from whimple fruit, and minute embryo lying in 2 great concentric circles or dotted vessels, its opposite exs it Piperacea and their allies, especially Chlorintheæ, with which mass of albumen. The latter characters bring it near Piperacea and their allies, especialy Chloranthea, the stipules
its zoneless wood for Chloranthus has no annual zones), simple fruit, and opposite leaves, also agree; but the

assured that the negroes on the farm, who are in the habit of drinking large quantities of this vegetable milk, consider it as highly nutritive; an assertion which startled us the more, as almost all lactescent vegetable fluids are acrid, bitter, and more or less poisonous. Experience, however, proved to us, during our residence at Barbula, that the virtues of the Cow Tree, or Palo de Vaca, have not been exaggerated. This fine tree bears the general aspect of the Star-apple Tree (Clarysophyllum Cainito) ; its oblong, pointed, coriaceous, and alternate leaves are about 10 in . long, and marked with lateral nerves, that are parallel, and project beneath. The flower we had no opportunity of seeing; the fruit is somewhat fleshy, and contains one or two kernels. Incisions made in the trunk of the tree are followed by a profuse flow of gluey and thickish milk, destitute of acridity, and exhaling a very agreeable balsamic odour. It was offered t \(\ell\) us in calabashes; and, though we drank large quantities of it, both at night before going to bed, and again early in

History, Use, Propagation, Cuiture,
the morning, we experienced no uncomfortable effects. The viscidity of this milk alone renders it rather unpleasant to those who are unaccustomed to it. The negroes and free people, who work in the plantations, use it by soaking bread in it made from Maize, Manioc, Aropa, and Cassava. Slaves become visibly fatter during the season when the Palo de Vaca yields most milk. When exposed to the air, this fluid displays on its surface, probably by the absorption of the atmospheric oxygen, membranes of highly animal nature, yellowish and thready, like those of cheese; which, when separated from the more watery liquid, are nearly as elastic as those of caoutchouc, but in process of time exhibit the same tendency to putrefaction as gelatine. The people give the name of cheese to the curd which thus separates when brought into contact with the air, and say that a space of 5 or 6 days suffices to turn it sour, as I found to be the case in some small quantities that I brought to New Valencia. The milk itself, kept in a corked bottle, had deposited a small portion of coagulum, and, far from becoming fetid, continued to exhale a balsamic scent. When mingled with cold water, the fresh fluid is coagulated with difficulty; but contact with nitric acid produced the separation of the viscous membranes.
"This wonderful tree appears peculiar to the cordillera of the shore, especially from Barbula to the Lake of Maracaybo. Some individual Cow Trees are also said to exist near the village of San Mateo, and likewise in the Valley of Caucaguea, three days' journey to the east of Caraccas.
"At Caucaguea, the natives call the tree which yields this nutritive fluid, Milk Tree (Arbol de leche)."
"The wood forming the body of the trunk is white, very close-grained, and hard, resembling the boxwood of Europe. The soil which these trees inhabit is dark and rich, and must be damp or very wet all the year round." (Bot. Mag.)
2851. Semecärpus 18108 Anacárdium is a lofty tree with spreading branches. Leaves about 18 in . long, and about 4 or 5 broad. Flowers small, of a greenish yellow colour. Receptacle of the fruit when ripe yellow, about the size of the nut, which is black; the cover or shell is composed of 2 laminæ, the inner hard, the outer less so and leathery; between them are cells which contain the black, corrosive, resinous juice, for which this nut has beer long known; the juice is of a pale milk-colour till perfectly ripe, when it becomes black. The wood of this tree is reckoned of no use, not orly on account of its softness, but also because it contains much acrid juice, which renders it dangerous to cut down and work upon. The fleshy receptacles on which the seeds rest are roasted in the ashesp and eaten by the natives; their taste is very like that of roasted apples : unroasted, they taste astringent and acrid, leaving a painful sensation on the tongue for some time. The kernels are rarely eaten. The green fruit, well pounded into a pulp, makes good birdlime. The pure, black, acrid juice of the shell is employed by the natives externally to remove rheumatic pains, aches, and sprains: in tender constitutions it often produces inflammation and swelling; but where it has not these effects it is an efficacious remedy. It is employed by the Telinga physicians in the cure of almost every kind of venereal complaint. It is in general use for marking cotton cloths; the colour is improved and prevented from running by a little mixture of quicklime and water. This juice is not soluble in water, and is only

18108 Lvs, oblong bluntish glauc. ben. more or less covered on the nerves beneath with scabr. down, Panicle terminal tomentose

18109 Leaves obovate very blunt villous

and Miscellaneous Particulars.
diffusible in spirits of wine, for it soon falls to the bottom, unless the menstruum be previously alkalised. The solution is then pretty complete, and of a deep black colour. It sinks in expressed oils, but unites perfectly with them : alkaline lixivium acts upon it with no better success than plain water. (Don's Mill., ii. 63.) Culture, sc., see Melanorrhoe'a below.
2851. Melanorrhoe'a 18109 usitata. This tree is a native of Hindostan, in a large valley called Kadbbu, in the kingdom of Munipur, Silhet, and Tipperah, as well as in the Burmese empire, on the banks of the Irrawadi, where it is called Theet-tsee or Zit-si. This is identical with the majestic Kheu or varnish tree of Munipur, on the north-east frontier districts of Silhet and Tipperah. Mr. M. R. Smith, who has resided a long time in Silhet, considers this the same as the varnish tree of the Chinese, in the eastern and north-eastern provinces. It is procurable in great quantities from Munipur, where it is used for painting river craft, and for varnishing vessels destined to contain liquid. The drug is conveyed to Silhet for sale by the merchants. On being handled it occasions extensive erysipelatous swellings, attended with pain and fever, but never of long duration. In the neighbourbood of Prome a considerable quantity of varnish is extracted from the tree, but yery little at Martaban, owing, it is supposed, to the poorness of the soil, and partly also to there being none of the people in that part whose business is to perform the process, although it is very simple. Short joints of a thin sort of bamboo, sharpened at one end, and shut up at the other, are inserted in a slanting direction into holes made in the trunk and principal branches, and left there for 24 or 48 hours ; after which they are removed, and their contents emptied into a basket previously varnished over. Sometimes a hundred bamboos may be seen sticking into the tree at once during the collecting season, which last as long as the tree is destitute of leaves, namely, from January until April, and they are renewed as long as the juice will flow. In its pure state it is sold at Prome at the rate of 1 tical, or \(2 s .6 d\). , the viss; and at Martaban, 2 Madras rupees the viss, although of an inferior quality to that sold at Prome, being usually mixed with oil of sesamum. A tree is reckoned to produce 2 to 3 or 4 viss annually, a viss being equal to \(3 \frac{1}{2} \mathrm{lb}\). Every article of household furniture destined to contain solid or liquid food is lacquered over with it. The article to be varnished with it must be prepared with calcined bones, after which the varnish is laid on thinly, either in its pure state, or variously coloured. The process of drying is the most difficult part, being effected in a very slow and gradual manner, by the articles thus varnished being placed in subterraneous vaults for many months. The drug is also used as a size glue in the process of gilding; nothing more being required than to besmear the surface of the article to be gilded with it, and immediately to apply the gold leaf. If it is considered how very extensively that art is practised by the Burman nation, it being among their most frequent acts of devotion and piety to contribute to the gilding of their numerous religious edifices and idels, it will be evident that a great quantity of the drug must be consumed for that purpose alone. Finally, the beautiful Pali writing of the religious order of the Burmas, on ivory, palm leaves, or metal, is entirely done with this varnish in its native and pure state. (Don's Mill., ii. 67.) A mixture of loam and peat will suit this tree ; and ripened cuttings will root in sand, under a hand-glass, in heat.

The following additional Figures are illustrative of Plants described in Pages 1300. 1304. and 1832.

History, Use, Propagation, Culture,
2855. Porphyrócoma is a beautiful plant, with dense heads or spikes of purple bracts, and purplish-blue fowers. Culture and propagation are the same as those recommended for Justicia, p. 18.
2856. Phlogacánthus. Pretty shrubs cultivated in the same manner as Justicia, p. 18.
2857. Cyrtanthèra. The species are all splendid plants, when well grown. They succeed best in a warm part of a stove. A mixture of good loam, leaf mould, and turfy peat is the best soil for them. In order to insure large heads of flowers, the plants should be shifted into larger pots when necessary. They are readily propagated from cuttings.

18155 Leaves lanceol. nearly sessile entire, Spikes terminal and subterminal aggregate, Bracts large 1 -flowered
18156 Stems quadrangular downy, Leaves large elliptic acute at both ends toothed glabrous, Corolla elongated
18157 Leaves oblong attenuated at both ends subcrenulated, Racemes terminal, Flowers fascicled
18158 Leaves on longish petioles broad cordate acuminate entire, Thyrse large compact, Bracts and sepals lin. subul.
18159 Leaves broad elliptic-lanceol. tapering into the thick short petioles. Thyrse compact, Bracteoles and sepals lanc. 18160 Leaves on longish petioles ovate-acuminate, Bracts and sepals ovate-lanceolate, Thyrse compact

18161 Glabrous, Lvs obl. acuminated, Racemes terminal elong. simple, Ped. short 1-flwd fascicled, Cor. nearly regular
18162 Downy, Lvs obl.-lanc. rug., Thyrse interrupted naked many-flwd, Cor. inflated funnel-shpd with glandular limb 18163 Glabrous, Lvs lanceol. acum. sessile, Pan. terminal short thyrsoid bracteate, Cor. elongated nearly regular 18164 Glabr., Lvs nearly sess. obl. lanc. erosely denticulated, Rac. axil. many-flwd nodding, Cor. tubularly ventricose

18165 Plant pale yellow, stemless, with slender graceful one-sided drooping spikes
[than the leafy calyx
18166 Stem hairy flexuous, Lvs cordate-ovate wrinkled crenate whitish beneath, Pan. terminal, Cor. hardly longer 18167 Clam. vil., Pet. wing. dent. perfol., Lvs ov. cord, at base doubly ser. aanesc. beneath, Pan. lar., Lower lip lar. ob. 18168 Branches glabr., Lvs approximate cuneiform ovate deeply ser. hoary and tomentose beneath, Corymbs terminal 18169 Branches clammy, Lvs lanceolate acuminate denticulated glabrous, Corymbs terminal, Pedicels clammy 18170 Viscid, Lvs linear remotely serrated, Panicles terminal leafy, Ped. opposite corymbose, Lower lip large inflated 18171 Pilose, Lvs ovate-lanceolate crenately serrated, Panicle corymbose, Lower lip large obovate-orbicular 18172 Lvs oblong obtuse entire clammy, Corymbs terminal, Outline of Corolla square

18173 Leaves of two forms, outside ones small imbricate, inner or upper ones fewer obovate spatulate obtuse concave, Spur curved, Ovarium villous
18174 Downy, Leaves ovate-acuminate coarsely serrated, Spike elongated dense, Bracts orbicular awned, Tube of Corolla curved
[white hairs, the nerves purple, Whorls large 18175 Stem quadrangular, internodes long, Leaves lanceolate subcordate subamplexicaul serrated fringed with 18176 Stem fist. tetrag., Lvs. ov.-lanc. cord. at base wavy ser. bullate downy, Floral lvs smaller redsh-vi. Cor. twist. 18177 Stem tetragonal, Leaves lanceolate acuminate serrated oblique at base, Floral leaves long acuminate white in the middle, Whorls globose approximate
18178 Leaves roundish-cordate sinuately crenated wrinkled above downy beneath, Whorls terminal few-flowered 18179 Hab . of \(S\). fulg., but the upper lip of cor. is flatter, the tube longer, the flws far more abundant and conspicuous 18180 Stem sim. pil., Lvs ov.-obl. obt. cren. nrly glabr., Whorls abt 4 -flwd lower remote, Cal. hairy, Up. Lip triden. 18181 Stem villous, Lvs obl. toment., Scapes naked glabrous, Pan. elong. bran. viscid, Cal. 5-toothed, Cor. glandular 18182 Erect villous, Leaves stalked cordate-sagittate, Floral ones ovate, Rac. branched, Whorls 6-flwd, Calyx clammy 18183 Procumb. at base, Bran. erect downy, Leaves ov.-ob., Whorls 2 -flwd one-sided, Cor, downy, Lips nearly equal 18184 Stm pil., Lvs ov.-deltd hastate cren., upper lvs lanc. lin., Whrls few remote, Stam. much exserted, Cor. large 18185 Leaves ovate serrate-crenate rounded at base downy beneath, Whorls 6 -flowered one-sided, Style bearded

18186 Branches smooth, Leaves coriaceous linear-lanceolate entire glaucous, Flowers \(2 \frac{1}{\overline{3}}\) inches long
\(1818^{7}\) Lower lip of Corolla trifid twice as long as the tube, Racemes terminal one-sided simple, Pedicels solitary 4-bracted, Leaves unequal-sided
18188 Leaves opposite wrinkled ovate, Flowers racemose large tubular

18189 Scabrous, Leaves opposite unequal orate-elliptic serrated, Peduncles axillary aggregate bifid or dichotomous, Flowers diandrous

and Miscellancous Particulars.
2858. Thyrsacainthus. These are splendid stove plants, and should be treated in the manner recommended for Cyrtanthèra.
2859. Rhynchoglóssum xeylánicum is a curious plant of easy culture. It requires heat and moisture. Being an annual, the seeds may be raised in a frame.
2860. Pterostágma. A pretty greenhouse plant, with large purple flowers. It should not be too much exposed to the sunshine. It is propagated by cuttings.
2861. Liebigia is a lovely plant, and requires the same treatment as others of the order Cyrtandracea.
2862. 67 a. CHONDROSPE'RMUM Wall. (Chondros, a lump; sperma, a seed.) Otène.

History, Use, Propagation, Culture,
2862. Chondrospermum. This is a rambling evergreen shrub, with ash-coloured separating bark, and large coriaceous 3 -nerved leaves, and terminal panicles of small greenish-yellow flowers. The erect position of the ovula seems to indicate its belonging to Jasminea, but the æstivation of the corolla is valvate. It does very well if trained to a trellis, or for covering a pillar in a stove. It is readily increased by cuttings in the ordinary way.

18190 Scandent, Branches tetragonal, Leaves opposite petiolate oval acuminated 3-nerved glaucous, Panicles terminal and axillary

18191 Leaves sinuated spiny-toothed, Floral leaves Corollas and Rachi villous, Lobes of Calyx cuneate oblong emarginate
[lanceolate linear, Lower part of Tube hispid upper part silky 18192 Involucrum \(4-1 v d\), Lvs ovate glabrous ciliated equal in height to the crowded heads of flowers, Lvs opposite 18193 Lvs linear-obl. glaucous glabrous, Heads round many-flwd, Calyx vill., Lvs of Involuc. ovate-acum. coloured 18194 Iavolucrum 4-leaved, Leaves oblong decussate glabrous, Tube of Perianth hairy
18195 Lvs lanc. downy beneath, Flws diœecious, Male heads pedunc. naked rather pilose, Lvs spatulate linear
18196 Invol. 4-1vd, Lvs ov. glabr. about eq. in length to the head, Peri. artic. above [length of flws, Hds dense
18197 Lus lin. glabr. above clthd. with white villi ben. as well as stem, upper ones nar. numer. subverticil. imbr. 18198 Lvs alter. rarely opp. lin. spat. pilose, Hds terml many-fiwd, Style and Stam. equal in length to the perianth 18199 Lvs oval or oblong obtuse glabrous, Invol. 4-lvd, Flowers villous in heads, Segments of Corolla oblong obtuse 18200 Invol. 4-leaved, Leaves broad ovate glabrous, Tube of Perianth hispid, leaves decussate oval coriaceous 18201 Invol. 4-lvd, Lys roundish obl. shorter than the fiws, Perianth villons, lvs obl. glabr, tapering to both ends
18202 Glabr. glauc., Lvs opp. subsecund broad lanc., Lvs of Invol. 4-5, Heads many-flwd, Segms. of Limb ciliated 18:n3 Invol. 4-lvd, Lvs ov. silky inside half shorter than hds, Tube of Peri. silky, Ivs lin. longer than internodes 18204 Lvs decus. ov. obl. or lanc. tapering to ends hoary powdery, Floral lvs shorter than hds, Fiws. very numerous
[branches, Racemes axillary few-flowered, Calyx and Corolla tetramerous 18205 Leaves pinnate, Leaflets lanceolate spiny-mucronate marginate smooth above downy beneath as well as the 18206 Leaves simple narrow oblong some having 2 stiff sharp points others with only one, Racemes short axillary 18207 Lvs simple obl. elliptic mucron. dotted downy beneath, Racemes short axil., Anthers obtuse and biporose
2865. 156a. Apèra. Spikelets laterally compressed 1-flowered with a superior rudiment. Glumes 2. the upper larger, 3 -nerved, about as long as the outer palea. Paleæ unequal, scarious, outer ones dorsally awned. Stigmas nearly sessile. Seed free.

\section*{MONOGYNIA.}

18208 Scandent glabrous, Stem terete, Lvs cordate-triangular acuminated toothed at base, Flws panicled minute 18209 Root large tuberous, Leaves pinnate, Segments linear acute toothed or entire, Flowers capitate or corymbosely panicled, Stamens exserted, Fruit downy
18210 Lvs ovate petiolate glabrous, Involucrum cordate ciliated, Stems creeping, Sheaths ciliated
18211 Lvs petiolate ovate-elliptic downy, Sheaths pilose ciliated, Cilia long brown, Spathes on short peduncles cucullate turbinate, Peduncles twin in the spathes one bearing two hermaphrodite flowers and the other one male flower
18212 Leaves linear sulcate much Ionger than the scape, Segments of Perianth ovate blue with white bases
18213 Lvs linear sulcate much longer than scapes, Segments of Perianth oval white with yel. bases purplish outside
18214 Corms edible, Leaves slender 8 inches long, Stems 4 inches, Bracts of involucrum equal
18215 Scapes much longer than leaves, Leaves ensiform, Flowers secund
[recurved with eq. lin. segments 18216 Stem simple, Spikes secund, Flws erect, Perianth clav. arched bilab., Upper Lip oblong tridental lower 5-parted 18217 Stem branched, Spikes panicled flexuous many-flowered, Segments of Perianth oval, Stamens white length of perianth
18218 Corm middle-sized, Leaves erect glabrous \(\frac{1}{3}\) inch broad, Stem about 10 -flowered, Bracts 3 inches
18219 Corm large, Lvs broad rather glauc., Stem strong erect many-flwd, Bran. 2-3-fiwd, Limb of Perianth undul., 18220 Stem early 10 -flwd, Flws crowded secund, Bracts eq. to tube
[Flws bifarious or looking two ways

and Miscellaneous Particulars.
2863. Labichea. The species of this genus are beautiful shrubs when in blossom. A mixtiure of peat, loam, and sand suits them, and cuttings will root under a hand-glass. It is rather a remarkable Leguminous genus with diandrous flowers.

History，L＇se，Propagation，Cullure，
2864．Sonerila．This is a pretty annual having little of the habit of a Melastomaceous plant；it is more like a Tremuindra．It grows best in peat earth or vegetable mould，with plenty of heat and moisture，not too much Tremundra．It grows best in peat earth or vegetable mould，with
18239．Páspalum exille is a Lilliputian grain which is described by Mr．Clarke as being about the size of Migno－ nette seed，and is stated to be cultivated about some of the villages of Sierra Leone by industrious individuals of the Soosoo，Foulah，Bassa，and Joloff nations，by whom it is called＂Hungry Rice．＂The ground is cleared for its recep－ tion by burning down the copse－wood，and hoeing between the roots and stumps．It is sown in the months of May and June，the ground being slightly opened，and again lightly drawn together over the seed with a hoe．In August， when it shoots up，it is carefully weeded；it ripens in September，growing to the height of \(1 \frac{1}{2}\) foot；and its stems，which are very slender，are then bent to the earth by the mere weight of the grain．They are reaped with hooked knives． Manure is said to be unnecessary or injurious；the plant delighting in light soils and being raised even on rocky situ－ ations．When cut down it is tied up in small sheaves and placed in a dry situation within the hut；for，if allowed to remain on the ground or to become wet，the grains become agglutinated to their coverings．The grain is trodden out with the feet，and is then parched or dried in the sun，to allow of the more easy removal of the chaff in the process of pounding，which is performed in wooden mortars．It is afterwards wirnowed with a kind of cane fanner on mats． In preparing this delicious grain for food，Mr．Clarke states that it is first thrown into boiling water in which it is assiduously stirred for a few minutes．The water is then poured off，and the natives add to it palm oil，butter，or milk；but the Europeans and negroes connected with the colony stew it with fowl，fish，or mutton，adding a small

18221 Corm mid. size, Stem 2 feet slender upds, Fl. about 9 secund bracteate Margin of limb of Per. plic, Caps. 18222 Corm large, Stem strong, Flowers above 12 bracteate secund, Capsule wrinkled
[turbinate trisulcate 18223 Corm large, Stem strong branched, Flowers bracteate looking one way, Bracts ovate striated, Upper 3 segments of Perianth broad oblong ohtuse, lower 3 narrow emarginate
18224 Leaves broad quite entire acute shorter than the many-flowered contracted panicle, Rachis deeply furrowed downy, Branches all simple, Flowers secund white glabrous
18225 Limb of Perianth longer than the subventricose tube, Leaves fleshy channeled
18226 Segments of Perianth oblong-linear, Scales ligulate, Flowers umbellate, Scape slender, Leaves linear chan. neled, Bulb small
18227 Leaves long linear smooth smelling like garlic when bruised, Peduncles unequal

18228 Beardless, Lvs ensif., Segments of Cor, nearly eq., Tube very long beardless

18239 Glabrous filiform, Racemes in threes digitate, Spicules small in two rows pedicellate, Glumes ovate acute equal to the palex, Leaves linear with serrulated edges
18240 Panicle elongated close, Anthers oval
18241 Panicle whorled spreading, Beard long

18242 Panicle coarctate imbricated on all sides by spikelets

18243 Panicle erect rather spreading, Spikelets ovate of 3 or 4 ribbed florets, Outer Paleæ with 5 nerves 18244 Panicle erect large rather close, Spikelets ovate of 2 or 3 acute florets, Outer Paleæ with 5 nerves

18245 Spikelets longer than the glume, Flowers elliptic, Roots annual destitute of sterile shoots

plece of salt pork for the sake of flavour, and the dish thus prepared is stated to resemble kous-kous. The grain is also made into pudding with the usual condiments, and eaten either hot or cold with milk. The Scotch residents sometimes dress it as milk porridge. Mr. Clarke is of opinion that if the Fundi or Fundungi grain were raised for exportation to Europe it might prove a valuable addition to the list of light farinaceous articles of food in use among the delicate and convalescent. The plant much resembles Digitaria, and is called Fundi, Fundungi, or Hungry Rice.
2865. Apera is a genus of rather pretty grasses. Being annual the seeds only require to be sown in the open ground.
18242. Dáclyli's caspitòsa is the famous Tussock grass of the Falkland Islands. It is also abundant in Terra del Fuego, Straits of Magellan, Cape Horn, \&c. Commerson discovered it first in the Straits of Magellan in 1767. It will thrive in pure sand near the sea, where it has the benefit of an atmosphere loaded with moisture, of soil enriched by decaying seaweed, and of manure which is in the Falkland Islands composed of guano. It is a gregarious grass, extending in patches sometimes for nearly a mile, but is seldom seen beyond the influence of the sea air in the places of its natural growth. It will, however, thrive far from the sea. When cultivated, Governor Moody of the Falkland Islands says, he knows of no grass likely to yield so great an amount of nourishment as the Tussock grass when thoroughly established. He recommends it not to be grazed, but cut and reaped in bundles, for if cut it quickly shoots again; but it is much injured by grazing, for all animals, especially pigs, tear it up to get at the sweet nuttyflavoured roots. The Tussock has been used abundantly when made into hay, being preferred by cattle even to its green state. Plants of the Tussock grass six feet high were exhibited in the Crystal Palace in 185l, by Peter Lawson and Sons, raised from seed by them in the Orkney Islands.

Spike straight cylind., Outer Paleæ trifurcate white and petaloid during florescence, sometimes the 2 lateral points are short and incomplete
2868. 252a. Anthirium. Spathe short, deflexed. Spadix nearly sessile, cylindrical, densely beset with flowers Sepals 4. Stamens 4, opposite the sepals. Filaments flattened. Anthers 2-celled. Berry 2-celled, 2-4-seeded. Stigma sessile, oblong.
2869. 280a. Ophėlia. Corolla rotate, 4-5-parted, each segment furnished with 2 distinct or combined nectariferous naked pores, or glands, at base. Seeds angular, scabrous. Stamens 4-5. Capsule l-celled, 2-valved, margius of valves placentiferous.
2870. 296a. Campylobóthrys. Calyx 5-cleft, segments with \(2-3\) glands, Corolla 4 -parted, segments unequal. Stamens inserted in the throat of corolla, exserted. Ovary tetragonal, fleshy, 2-celled, with an epigynous, fleshy, lidformed disk, many-seeded.

\section*{MONOGYNIA.}

18247 Lvs filiform obsoletely sulcate, Scales of Strobile nerved ovate
[Perianth silky tomen., Stigma glabr. 18248 Bran. glabr., Lqs long lin. obt. apic. striated on both sides simp. or 2-3-parted, Strob. ov. axil., Scales ov. shin., 18249 Bran. glabr., L.vs terete not sulc. spiny at top, Strobile term. ov. sess., Scales glabr., Perianth tomen*, Upper 18250 Lvs bitripinnatifid filif. silky sulcate above, Strobile ov. sess., Scales ovate silky [joint of Stigma bearded 18251 Lvs flat ternate, Leafets bifid, Lobes ovate mucronate, Strobiles axillary, Scales silky
[glabr., Lobes villous, Stigma articulated glabr.
18252 Bran, tomentose, Lvs, nar.-lanc, downy mucronate, Strob, nearly globose, Scales ovate-acuminate villous, Calyx 18253 Dwny, Lvs lin. chan. scabr. subbiter., Seg.ent. or trif. muc., Strob. spher., Scls ov.imb., Stig. elon., Up. jnt hairy 18254 Bran. toment., Lus glabr, on long petioles 3-parted, Leaflets cuneated, lateral ones 3-4-cleft, middle one broader 5-cleft, Strobiles ovate sessile tomentose, Calyx glabr. elongated villous at top
18255 Bran. elongated reddish villous while young, Lvs oblong sessile subcordate at base ciliated with wool, upper ones silky, Involucrum turbinate, Style glabrous
[Perianth downy exceeding the tube
18256 Lvs linear-filiform a little channeled veinless, Ped. elongated scape-formed, Corymb nearly simple, Limb of 18257 Lvs oblong flat veiny, Ped, elongated scape-formed, Corymbs compound, Limb of Per. glabr. exceeding tube 18258 Lvs' lingulate-oblong tapering to the base flat 3 -nerved veiny glabrous, Pan. pedunculate formed of alteruate spikes, Rachis and bracteas woolly
18259 Lvs obovate entire glabrous
18260 Lvs cuneate silky dentately crenate
18261 Lps filiform trifid, lateral segments bifid, middle one undivided, Flowers terminal
18262 Pilose, Lvs oblong-lanceolate obtuse triple-nerved, Flws axillary solitary pedunculate, Invol. spreading villous, Perianth pilose bearded at top
18263 Lvs lanceolate villous soft beneath, Perianth bearded, Ovarium 2-seeded glabrous
18264 Lvs lanceolate-spatulate mucronate concave scabrous on buth sides with crystalline dots
18265 Lvs elliptic-lanceolate mucronate flat nearly veinless, Branchlets silky, Perianths awned downy
18266 Glabrous, Lvs broad-ovate obtuse veiny narrowed at base, Perianths mutic downy, Style of Ovary not articulated, Stigma dilated
ddown as well as branches
18267 Lvs filiform bisulcate beneath, adult ones glabrous, Peduncles axillary solitary cinereous from short spreading 18268 Bran. tom., Lvs filiform furrowed beneath, floral ones short, Flws solitary axil., Per. tom., Ped. pilose, Ov. glabr. 18269 Bran. downy, Lvs falcate linear-lanc. elongated, Ovaries barrow at base glandular, Flws solitary, l'ed. and Per. tomentose, Anth. linear, Stipe of Ovary articulated

18270 Quite smooth, Lvs cuneate tapering into the short pet. flat 3-nerved semi-trifid, Lobes [gent, Rac. stalked simple undivided or 2-3-cleft pun[the lvs, Rach. and Per. glabrous 18271 Bran. ang. silkj, Lvs obl. spin. thd cumeate at base quite ent. silky ai, ti retic. ben. flat above, Rac. shorter than 18272 Lvs bipinnatif, glab., Ract. flex. wngd, Lbs decur. trian. elon., Per. glab., Rac. dense-stalked my-fiwd, Per. glab.

and Miscellaneous Parliculars.
231. Proteacea. In the Botanical Magazine there are some valuable remarks on the culture of Proteacice, by Mr. John Smith, practised for many years at the lloyal Botanic Gardens at Kew, which we here extract. "Within the last twenty or thirty years the cultivation of Proteacee has declined, the species have gradually disappeared from most of the private collections around London, and but few nurserymen now take an interest in them. This change may die, even when in a vigorous state of health. preserving them; for, under certain circumstances, the plants suddenly die, even when in a vigorous state of health. In the Royal Botanic Gardens at Kew, Proteäcea have maintained their

and Miscellaneous Particulars.
in our opinion, accounts for the frequent sudden death of plants of this kind. We use good yellow loam, to which, for mmall plants, we add a little sharp sand. In shitting or repotting a plant we make it a rule to keep the ball of roots a little elevated above the surface of the new mould, lo prevent auy superabundance of water from lodging round the base of the stem. In the winter, care must be taken to give no more water than is absolutely required to keep the soil moderately moist; but, in summer, water may be freely given in the evening or morning. It is important that the plants should be so placed that the sun's rass do nut strike the sides of the pot. The Proteacee do not readily propa-

History，Use，Propagation，Culture，
gate from cuttings，but may be more readily increased by grafting on any of the more free－growing species．Imported seeds germinate freely．＂（Bot．Mag，for 1850，no．4528．）

Before the introduction and high state of cultivation of the splendid flowering plants now annually exhibited in the vicinity of London，it was customary to estimate the value of public and private collections by the number and rarity of the species，without regard to the circumstances of their producing fine flowers．Perhaps no tribe of plants were in higher repute than those belonging to Proteacere，as is amply shown by the early volumes of the Bot．Mag．

and Misc.llaneous Pariiculars.
2868. Anthùrium is separated from the old genus Pcthos by Schotte and Endlicher, and perhaps rightly so. The American species of Pothos mostiy belong to this genus. The type of the genus Pothos, according to these botanists, is the Pothos scandens of Limnæus (Bot. reg. 1837). The species require the same treatment as that recommended for the stove species of Pothos or \(A^{\prime}>u m\).

is imbibed. Some mix sugar with it, others add a few drops of lemon juice; and by pouring fresh boiling water the infusion may be renewed. The Creoles are very fond of it, and never travel without a supply. They drink the infusion at every meal, and never eat until they have taken some of it. It must be drunk directly, for if suffered to remain long the liquor would become as black as ink. The pipe of the mate or teapot, called bombilla, is perforated with holes at the top to prevent swallowing the pulverised herb. The whole party is supplied by handing the mate and pipe from one to another, filling up the vessel with hot water as fast as it is drunk out. The repugnance of Europeans to drink after all sorts of people, in a country where diseases are so common, has occasioned the intro-

duction of small glass tubes with which each person is sometimes provided. The leaves when green taste something like mallow leaves; they are roasted and dried, and almost pulverised, before they are packed. There are three kinds of it in its prepared state, although produced by the same plant, which go under the names of Caa-cuys, Caa-mini, and Caa-quazu; the first is the buds of the leaves when hardly expanded, the second is the leaves stripped of the ribs before roasting, and the third is roasted without any preparation. The people boast of the innumerable qualities that this herb possesses. It is certainly aperient and diuretic, but the other qualities attributed to it are rather doubtful. Like opium it produces some singular effects; it gives sleep to the restless and spirit to the torpid. The

2887. 385 a. Rivea. Sepals 5. Corolla funnel-shaped, Stigma capitate, 2-lobed. Orarium 4-ceiled, 4-ovulate.

Capsule baccate.
2888. 385b. Mina. Calyx short, naked, Corolla salver-shaped: Tube short, contracted at the base : Limb ventricose. Stigma capitate. Stamens unequal, exserted. Ovarium acelled. Cells 1 -seeded.
2889. 385c. Calbòa. Sepals 5, furnished with a subulate process on the back of each. Corolla with a curved cylindrical tube and a campanulate 5-lobed limb. Stamens declinate.
2890. 395d. Cyathodes. Calyx with many bracts. Corolla funnel-shaped, without any hairs or glands : Limb spreading. Stamens enclosed. Ovarium 5-10-celled. Drupe baccate.
2891. 401a. Cystánthe. Calyx foliaceous. Corolla closed, hood-formed, dehiscing transversely, with a truncate persistent base. Stamens hypugynous, persistent. Hypogynous scales 5.
2892. 411a. Alyxia. Corolla salver-shaped: Throat naked. Stamens enclosed. Stigma obtuse, usually pencilled. Drupes 2, solitary by abortion.
2893. 413a. Aganósma. Corolla funnel-shaped. Hypogynous scales long, combined. Stigma conical, mucronate.
2894. 413b. Mandevilla. Calyx 5-leaved, furnished with a pectinated ring inside. Corolla funnel-shaped: Throat naked. Filaments enclosed. Anthers conniving into a cone around the stigma. Stigma conical, having 5 pits or hollows at the side, with a 5-lobed campanulate base, and a bicuspidate apex. Hypogynous ring 5-lobed, fleshy. Lobes truncate.
2895. 41jsc. Roupéllía. Calyx 5-parted, with a circle of about 12 glands at the base. Corolla funnel-shaped: Throat crowned by 10 combined ligulæ. Stamens enclosed. Style dilated at top into a 5 -furrowed mass, to which the anthers adhere Nectary wanting.
2896. 413d. Dipladenia. Calyx 5-parted: Lobes with \(1-2\) glands at the base of each. Corolla funnel-shaped, hispid about the origin of the stamens. Anthers sessile. Glatuds 2, alternating with the ovaria. Stigma globular, with a reflexed membrane at bottom.
2897. \(413 e\). Rhynchospérwum. Calyx 5 -cleft, or 5 -parted, with many glands inside the tube glar ds truncate. Corolla 5-cleft : Tube cylindrical: Lobes oblique-rbovate. Anthers hastate, adhering to the middle of the stigma. Nectary cup-shaped, 5-cleft. Stigma obllong. Follicles elongated, many-seeded.
2898. 414a. Parsónsia. Calyx 5-parted. Corolla funnel-shaped, 5-parted: Throat naked. Stamens exserted. Anthers sagittate, cohering by their midule to the dilated stigma. Hypogynous seales 5. Follicles 2, distinct ur combined

18392 Livs ovate bluntish serr. shining above, Pedicels aggreg. longer than petioles rising above axils of leaves
18393 Lvs obl. coriac. marginate trun. spinose on adult plants 3 -horned entire, Umbels axil. sessile, Berries 4 -seeded 18394 Lvs oval quite entire acute at both ends glabr., Umbels pedunculate shorter than the petioles, Fruit 4-seeded 18395 Lvs oval-oblong acuminated spiny-toothed
18396 Lvs elliptic-oblong mucronate remotely spiny-serrated, Flws sessile in axillary fascicles, Fruit 2-seeded
18397 Lvs ovate acute ciliately serrated, Pedicels axillary solitary 1-flowered drooping
18398 Livs oval or ovate coriaceous smooth quite entire, Peduncles numerous cymose axillary

\section*{and Miscellaneous Particulars.}
leaves are called in Paraguay Yerva-mate, and by the French Herbe du Paraguai. The Ilex Gongonha, the leaves of which afford a kind of tea called Gongonha in Brazil, and which by some is considered identical with that of Pardguay, grows in the provinces of Minas Geraes and St. Paul; and when the export of tea from Paraguay was prohibit d by Dr. Francia the dictator, the inhabitants of the other states, who were formerly supplied from Paraguay, were obliged to use that from Brazil, which was found to be much inferior. Persons ignorant of the specific distinctions between the two trees have attributed the inferiority of the Brazil kind merely to the different mode of preparing the leaves.
2899. 414b. Lyónsia. Calyx 5-cleft. Corolla funnel-shaped : Limb 5-parted: Segments equal-sided: Throat naked. Stamens exserted. Anthers sagittate, cohering by their middle to the stigma. Style dilated at apex. Stigma concave. Hypogynous scales connate. Capsule cylindrical, 2-celled ; dissepiment free.
2900. 418a. Adenium. Calyx 5-parted: Lobes lanceolate, glandular. Corolla downy with a cylindrical tube, widened upwards, and a 5 -parted limb. Stamens short. Anthers linear-sagittate, cohering to the stigma, terminated by a hair-like seta. Hypogynous glands none. Ovaria 2, globose. Stigma capitate, bidentate.
2901. 434a. Lacepedia. Calyx 5-parted. Petals short, unguiculate. Ovarium 3-celled. Cells 8-ovulate. Style trisulcate, at length tripartite. Berry tricuspidate, 6-9-seeded.
2902. 434b. Ullùcus Flowers membranous. Exterior Calyx open, joined, 2-parted : Inner one of 5 -segments or sepals, equal, awned. Stamens enclosed, joined at base into a fleshy urceolus. Ovarium ovate. Style short, thickened towards the apex. Fruit ovoid, hid by the unchanged calyx.
2903. 435a. Labisia. Calyx small, 5 -toothed. Corolla coriaceous, 5 -parted: Segments induplicately valvate in æstivation, reflexed and apiculated at apex. Style subulate. Drupe pea-formed, 1-seeded.
2904. 435b. Corynecúrpus. Calyx of 5 concave sepals. Corolla of 5 rounded petals, alternating with as many petal-like scales, which are furnished with a gland inside at base. Stamens rising from the claws of the petals. Stigma obtuse. Drupe club-shaped, containing a single 1 -seeded nut.
2905. 437a. Fagre'a. Calyx 5-parted. Corolla funnel-shaped: Limb 5-6-parted. Stamens 5-6, inserted in the mouth of the tube. Style filiform. Stigma orbicular. Berry 2-6-celled, many-seeded. Seeds angular.
2906. 445a. Habrothámnus. Calyx campanulate, 5-toothed. Corolla clavately tubular: Limb 5-toothed. Stamens enclosed. Stigma capitate, obsoletely 2 -lobed. Berry girded by the calyx, 2-celled. Seeds few, angular.
2907. 445b. Isochroma. Calyx tubular, a little inflated, 5 -toothed. Corolla tubular, 5 -toothed. Stamens enclosed. Style clavately capitate, bifid. Ovarium 2 -celled. Berry enclosed in the calyx. Seeds numerous, compressed, orbicular or reniform.
2908. 446a. Hebeclàdus. Calyx 5-parted. Corolla funnel-shaped, 5-lobed, usually with teeth between the lobes. Stigma clavately capitate, a l'tle 2-lobed. Berry globose, small. Seeds compressed, renitorm.
2909. 450a. Chanéstes. Calyx tubular, unequally 5-toothed, at length cleft laterally. Corolla tubular, 5-lobed, with floccose edges and with small teeth between the lobes. Stamens nearly enclosed. Stigma clavate, 2-lobed. Berry 2-celled, obovate, enclosed in the cleft calyx. Seeds many, wrinkled, reniform.
2910. 460a. Rogièra. This genus differs principally from Rondeletia by the absence of the prominent ring in the throat of the corolla.
2911. 460b. Péntas. Calyx 5-cleft, sometimes with 1 or 2 teeth in the sinuses. Corolla with an elongated tube, and a campanulate throat, which is bearded inside: Limb spreading, 5 -cleft. Stamens short. Epigynous disk thick. Style filiform, 2-lobed. Capsule nearly globose, many-seeded.
2912. 460c. Hindsia. Calyx turbinate : Limb 4-5-cleft: Segments unequal, foliacenus at top. Corolla funnelshaped, with an elongated tube, and a 5-cleft-limb. Anthers sessile at top of tube. Ovarium 2-celled. Branches of Style linear, papillose. Capsule corticate, 2 -valved.
2913. 460d. Higgínsia. Limb of calyx 4-5-toothed. Corolla salver-shaped, 4-5-parted: Throat naked. Stamens inserted in the middle of the tube, enclosed. Stigmas 2. Berry oblong, subtetragonal, many-seeded.
2914. 460e. Lindènia. Calyx turbinate, 5-ribbed: Limb 5-cleft Corolla salver-shaped, with a very long slender tube, and a 5 -parted spreading limb. Anthers sessile, linear. Style bifid at top. Capsule 2-celled. Seeds numerous, angular.
2915. 463a. Adenóphora. Calyx 5-cleft. Corolla campanulate, 5-lobed. Stamens free. Nectary girdin \({ }_{z}\) the base of the style. Style pilose. Stigmas 3 . Capsule 3-celled.
2916. 463b. Platycòdon. Calyx and Corolla 5-lobed. Stamens and Stigmas 5. Capsule 5-celled.
2917. 463c. Glossucòmia. Calyx 5-lobed, foliaceous, reflexed. Corolla campanulate, 5-lobed. Stigmas 3, ovate. Capsule 3-celled.
2918. 464a. Isulòma. Calyx 5-parted, nearly equal. Corolla salver-shaped or funnel-shaped, nearly equal : Segments nearly equal. Stamens combined into a tube. Anthers cohering, beardless, two lower ones mucronate. Stigma capitate. Capsule 2 -celled, many-seeded.
2919. 464b. Centropogon. Calyx 5-parted, with a globose tube. Corolla with an incirved tube, and a 5 -cleft limb: upper Segments larger, falcate; lower ones spreading. Two lower Anthers generally ending in an ovate, triangular, cartilaginous, solitary gland. Annulus fleshy, between the limb and the calyx. Berry globose, 2-celled.
2920. 477a. Weigela. Calyx pentagonal, adnate to the ovarium, 5-lobed: Lobes lanceolate. Corolla funnelshaped: Throat wide: Lobes ovate, roundish. Stamens adnate to the corolla. Style a little exserted. Stigma peltately capitate. Ovarium 2-celled, many-seeded.
2921. 485a. Rhodóstoma. Calyx tribracteate, 5 -cleft : Segments recurved. Corolla fumnel-shaped: Tube long: Limb 5-lobed; Segments lanceolate, mucronate by reflexed plicæ. Stamens short, inserted at top of tube. Ovarium 2-celled. Ovula solitary in the cells. Style simple. Stigmas 2, linear.
2922. 486a. Sherbournia. Lobes of calyx foliaceous, cuneate. Corolla fleshy, funnel-shaped: Tube narrow at base, hairy inside at base. Stamens short, inserted above the middle of the tube. Ovarium crowned by a large disk or hemispherical gland, Stigma clavate.
2923. 486b. Heinsic. Lobes of calyx foliaceous, oblong. Corolla salver-shaped, hairy, with 5 undulated lobes : Throat hairy, Anthers sessile. Style filiform. Stigmas 2, livear. Fruit globose, 2-celled, many-seeded. Soeds wingless, nestling on the superficies of the placentas.
2924. 507a. Catha. Calyx flat, 5-lobed. Petals 5. Capsule 3-4-sided, 3-4-celled. Cells l-seeded. Stigma 3-parted.
2925. \(515 a\). Sóllya. Calyx small, 5 -parted, the hind segment the largest. Petals \(\grave{3}\), ovate, nearly equal, campanulately spreading. Stameris erect. Anthers cohering at top. Ovarium terete, 2 -celled, many-ovulate. Style short, terete, continuous with the ovarium. Stigma obsoletely 2-lobed. Berry fusiform, dry, many-seeded.
2926. 515b. Prondya. Calyx 5-leaved: Leaves acuminate, equal. Petals 5, obovate, equal, campanulately conniving, subrevolute at apex. Stamens erect. Ovarium terete, 2-celled, many-ovulate. Style short, terete, articulated with the ovarium. Stigma acute. Berry cylindrical, many-seeded.
2927. 515c. Mariánthus. Calyx small, 5 -parted, equal. Petals 5, equal, spatulate, with conniving claws.. Stamens ascending. Ovarium declinate, oblong, compressed, 2-celled. Style filiform, subfalcate, continuous with the ovarium. Stigma capitate.
2928. 520a. Lemonia. Sepals 5. Corolla 5-cleft, unequal: Tube straight. Stamens 5, inserted in the tube; 2 fertile ones sessile; three sterile ones horned, longer than the tube, covered with glands. Disk cup-shaped, notched. Carpels 5, 1 -seeded.
2929. 520b. Pentarhaphia. Calyx of 5 narrow stiff lobes, not unlike 5 brown needles. Corolla tubular, 5 -cleft. Style projecting.
2930. 520c. Metroddrea. Calyx 5-cleft. Petals 5. Ovarium buried in the disk and confused with its substance. Fruit tubercled 5 -lobed, 5 -celled. Cells \(1-2\)-seeded.
2931. 520d. Almiéda. Calyx 5-toothed. Petals 5. Ovaries 5, connected at base. Fruit only of 1 or 21 -seeded carpels.
2932. 520e. Erythrochìton. Calyx tubular, 5-cleft, connected into two nearly equal lips. Corolla 5-cleft. Fruit of 51 -seeded carpels.
2933. \(524 a\). Corethróstylis. Calyx petaloid, 5 -parted. Corolla none. Style long, hispid from fascicles of bentback hairs, broom-formed. Capsule 3 -celled, 3 -valved. Cells l-seeded.
2934. 524b. Guichendtia. Calyx 5-parted. Petals 5, gland-formed. Ovary 5-celled. Cells containing 5 ovula.
2935. 541a. Schweiggèria. Sepals 5 , unequal, exterior ones hastately, biauricular at base. Lower petal large, cordate, drawn out into a spur at base. Stamens free. Appendages of anterior anthers subulate.
2936. 542a. Cryptándra. Calyx campanulate, 5-cleft. Petals small, cucullate, sessile. Stamens enclosed Anthers 2-celled. Disk wanting. Fruit containing 3 seeds.

Order 2. DIGYNIA. 5 Stamens. 2 Styles.
2937. 579a. Schubêrtia Calyx 5-parted. Corolia funnel-shaped. Corona simple, of 5 retuse lobes. Stigma turbinate. Gynostegium short.
2938. 590a. Trichoséchme. Calyx 5-cleft. Corolla with long feathery tails, which are perhaps analogous to the tails of Strophánthus.

History, Use, Propagatton, Culiure,
2871. Plumbaginélla being an annual, the seeds only require to be sown in the open ground, in a warm sheltered situation, in a mellow soil.
2872. Valoradia is a creeping-rooted pretty plant, and answers well to be planted out into beds in summer. If grows on the ruined ramparts of Shanghai in China, also out of the stone-work on the city wall.
2939. 592a. Dictyánthus. Calyx of 5 broad-lanceolate lobes. Corolla urceolate below: Limb reflexed, with 5 long horn-like segments, having the margins recurved. Corona simple, of 5 large spreading lobes.
2940. 592b. Cyrtúceras. Calyx \(5-\) parted. Corolla rotate, tomentose at base inside : Segments linear, acuminate. Corona smooth. Leaflets acuminated at both ends. Anthers oblong, obtuse, terminated by a bidentate membrane.
2941. 592c. Raphtstémma. Calyx 5-cleft. Corolla campauulate. Leaflets of simple Corona elongated, compressed. Follicles ventricose. Anthers each terminated by a membrane.
2942. 592d. Stephandtis. Calyx of 5 sepals. Corona simple, 5-leaved. Anthers terminated by a membrane. Follicles horizontal. Seeds pulpy.
2943. 592e. Oxypétalum. Calyx campanulate: Tube ventricose. Gynostegium exserted. Leaflets of simple corona fleshy, obtuse. Anthers each terminated by a membrane.
2944. 601a. Wigándia. Calyx of 5 sepals. Corolla funnel-shaped. Stamens exserted. Stigmas capitate. Capsule 2-celled. Placentas 4, at first joined by twos, afterwards free.
2945. 623a. Xanthdsia. Margin of calyx 5 -lobed. Petals stipitate, oval, cuspidate, replicate at apex. Style filiform, rising from the base of the stylopodium. Fruit compressed. Mericarps contracted at the commissure, with 7-9 filiform ribs, the 2 lateral ribs marginating.
2946. 623b. Astrótricha. Calyx 5-toothed. Petals 5, oval, clothed with stellate down outside. Styles thickened at base. Mericarps contracted at the commissure, with 3 primary dorsal ribs, and 2 acute nearly obsolete marginal ones, and 4 secondary ones with vittæ in the commisure, which are covered by a spongy pellicle, but none in the furrows.
2947. 668a. Nárthex. Margin of calyx obsolete. Stylopodium urceolate. Styles filiform, at length reflexed. Fruit compressed from the back, and girded by a dilated margin. Mericarps with 5 primary ribs, the 3 intermediate ones filiform, the 2 lateral ones close to the margin, and nearly obsolete. Vittæ in the dorsal furrow usually solitary.

\section*{Order 5. PENTAGYNIA, 5 Stamens. 5 Syles.}
2948. 669a. Grammänthes. Calyx 5-cleft. Corolla 6-lobed. Stamens 5-6, enclosed. Scales none. Styles and carpels 5.
2949. 706a, Acantholimon. Calyx funnel-shaped: Limb scarious, multiplicate, 5-nerved, shortly 5-Tobed. Corolla gamopetalous only at base, forming a ring, the rest free with long claws, the edges of the claws so close as to form a kind of tube. Ovarium linear, tapering into the 5 styles. Stigmas capitate. Utricle membranous, acutely 5 -sided, opening by a conical lid, and also splitting irregularly into 5 valves at base.

\section*{MONOGYNIA.}

18399 Annual, Stem terete, Leaves rhomboid, Petiole winged stem-clasping and auricled at the base, Spikes fewHowered, Bracts and calyx glandular
18400 Stem furrowed erect branched, Lower Leaves oblong a little denticulated with stem-clasping petiole, the rest [sessile cordately auricled, Spikes axillary and terminal

18401 Branches flexuous angular rather bristly, Leaves obovate obtuse ciliated, Flowers in dense bracteate 3-7flowered clusters, Lobes of Corolla obcordate

18402 Flowers beautiful dark purple, Plant more diffuse

18403 Leaves obovate rather strigose, Calyx covered with adpressed bristles, Corolla flat, Lobes somewhat emarginate 18404 Calyx beset with uncinate bristles, Limb of Corolla concave shorter than the tube
1840.5 Stem decumbent at base bristly, Segments of Calyx linear, Limb of Corolla with emarginate lobes

18406 Throat of Corolla glabrous naked, Limb twice shorter than the tube
18407 Throat of Corolla bearded, Limb 3 times shorter than the tube
18408 Throat of Corolla glabrous naked, Limb rather shorter than the tube
18409 Throat of Corolla glabrous half-closed by plicæ, Limb length of tube
[Flowers racemose panicled
18410 Stems branched, Leaves lanceolate, radical ones on long petioles, cauline ones sessile, upper ones bract-formed, 18411 Stems much branched hispid, Leaves linear bluntish hispid, Racemes few-flowered crowded
18412 Stems diffuse, Lvs linear-oblong obtuse hispid, Flws sess. aggregate 4 times shorter than bracts, Nuts spherical

and Miscellancous Parliculars.
2873. Amsinckia is a genus of pretty annuals. The seed only requires to be sown in the open ground in April, in a dry, warm, sheltered situation.

History, Use, I'ropagation, Culture,
2874. Macromeria is a fine half-hardy perennial, and grows best in an equal mixture of sandy loam and fibry prate It ripens seed if kept in a greenhouse, by which it is propagated. Its foliage is too coarse to make it a valuable ornamental plant; and its fowers, which always droop, fall ofr' soon after opening, so that it never looks so well as its showy appearance on paper or in the herbarium would lead us to expect.

18413 Stems decumbent, Leaves linear cbtuse hispid undulated longer than the stems, Racemes terminal few-f wered 18414 Strigose, Leaves linear-oblong coarsely toothed, cauline ones undulately curled, Spikes loose, Calyx inflated pendulous, Nuts triquetrous
[short in 1 series
18415 Pilose branched, Lvs oblong sessile, Racemes elongated, Flws nearly sessile, Nuts small marginate, Prickles 18416 Pil., Lvs obl. upper ones cordately stem. clasping, Racs bractless, Nuts marg., Prickles in 1 ser., Tube of Cor. long 18417 Clothed with whitish down, Rad. Lvs lanc. on long pets, caul. ones lin. lanc, sess., Pan. loose, Nuts mur. in disk 18418 Downy, Cauline Leaves ovate cuneated at base, radical ones cordate-ovate on long petioles, Racemes bractless, Nuts marginate glochidate
18419 Stems hispid, Leaves lanceolate mucronate scabrous, Style and Stamens much exserted
18420 Stems erect much branched, Leaves linear-lanceolate obtuse downy revolute and white beneath
18421 Erect pilose, Leaves sessile tomentose bluntish, radical ones oblong-obovate, cauline ones spatulate, Spikes terminal, Bracts foliaceous

18422 Shrubby, nearly glab., Lvs terete fascicled, Pedun. elong., Cal. hairy, Plicæ of Cor. pilose, Nuts many-celled
[lobe emarginate, the other tridentate, Ovary 5 - lobed 18423 Clothed with viscid down, Stems filiform, Petioles ciliate, Leaves ovate-obtuse, Calyx campanulate 2-lubed, one

History, Use, Propagntion, Culture,
2877. Cyanânthus is a native of the higher ranges of the Himalayas. It proves to be a delicate little herbaceous plant, with the habit of some species of Campánula. It requires plenty of moisture during the flowering season, but afterwards should be kept rather dry and allowed to rest.
287\%. Cántua is a genus of beautiful shrubs. The Peruvian Indians, according to Ruiz and Pavon, adorn their chambers on feast days with the C. buxifolia. The ancient Indians called it the magic tree. The species have proved hardy greenhouse plants, and thrive if potted in a mixture of light loam and peat containing a portion of sand. They possibly will grow freely in the rpen air during summer, if planted in a warm sheltered situation; some of them have succeeded in the open air in Devonshire. They may be treated in the same way as Fuchsias. Cuttings root freely.
2879. Desfontainea. This is one of the plants in whose external features there is nothing to lead to a knowledge of their affinities. It has been placed in Gentidnea, Solanicea, and Theophrästea by turns, It is an evergreen and a native of America, with a very bitier taste. T'he leaves are opposite petiolate spiny-toothed, very similar to those of

18447 Stems diffuse, Lvs downy, Leaflets cordate, Calyx hairy with blunt segments, Segments of Corolla obtuse 18448 Stem pilose erect with many pairs of ovate blunt pilose leafets, Flowers a little panicled drooping, Segments of Corolla round crenulated

18449 Pilose, Lvs rhomboid cinereous beneath lobed at top, Segments of Corolla bearded at top

18450 Lvs subfascicled obovate entire or toothed, Calyx tubular downy, Limb spreading, Lobes obcordate, Stamens slightly exserted
18451 Lvs elliptic or obovate downy entire or toothed, Corymbs branched, Flowers erect, Calyx bilabiate, Stamens much exserted
18452 Branches downy, Leaves fringed with soft hairs tomentose beneath cuneate-oblong mucronate, Flower large showy
18453 Pilose, Lvs pinnate or pinnatifid, Leaflets entire, Racemes loose, Corolla fringed

18454 Downy, Lvs entire or angular, Calyx cylindrical 5-ribbed cleft lengthwise, Limb of Corolla spreading, the Segments ending in long points
18455 Smoothish, Leaves quite entire, Calyx cylindrical inflated entire or unequally 4-5-lobed, Limb of Corolla spreading acuminated

18456 Calycine segments lingulate and are as well as the leaves glabrous, Leaves opposite spiny-toothed like those of holly, Flower terminal solitary
18457 Parasitical pendent, Leaves oblong acuminated thickish alternate, Racemes dichotomous pendulous
[5-inches, Stamens enclosed
18458 Leaves petiolate oval-lanceolate glabrous, Flowers solitary pendulous, Calyx pentagonal, Corolla very long 18459 Lvs peiolate ellip.-lanc., Pan. term. trichot., Flws pendulous, Stamens exserted, Branches bluntly tetragonal 18460 Lvs tinnnivent at the base, lower ones cordate, upper ones ovate, Peduncles dichotomous panicled, Flowers pendulous, Stem fistular acutely tetragonal

18461 Branches terete, Lvs decussate lanceolate acuminate 3-5-nerved, Panicle much branched loose, Flws pendulous 18462 Downy, branches tetragonal, Leaves lanceoldte or oblong-lanceolate, Flowers axillary and terminal pedicellate 18463 Strong, Leaves obovate-lanceolate acuminate, Petioles connate, Umbels many-flowered involucrate axillary, Calyx wingless, Stamens exserted

18464 Strong robust downy canescent, Stem dichotomous, Leaves twin ovate-elliptic repandly lobed villous beneath, Flowers solitary drooping

18465 Glandularly pubescent, Lvs ovate, Panicle terminal leafy, Flws nutant, Corolla funnel-shaped St [to corolla 18466 Leaves ovate repand or quite entire, Flowers pedicellate terminal capitate, Stamens enclosed, Fruit-bs equal Calyx indated angular glabrous
[Limb obcordate 18467 Glandular and clammy hairy, Leaves oblong-lanceolate undulated, Tube of Corolla cylindrical, Segments of

18468 Leaves palmately 5-lobed, middle lobe the longest, 2 lower lobes bipartite, Peduncles axillary 1-flowered
18469 Downy, Lvs 3-5-lobed, middle lobe acum. lateral ones ang. hairy on the veins beneath, Ped. 1-2-flwd, Sep. uneq. 18470 Stems filif. branched, Lvs glabr. sess. many-parted, Seg. filif., Ped. 1-flwd axillary, Sep. muricated on the back 18471 Scabr., Lvs 3-lobed, lateral lobes rounded middle narrower and longer, Ped. 3-fwd, Cal. covered with blk hairs

and Miscellaneous Particulars.
olly. The flowers are large, terminal, and solitary; they are scarlet with a yellow limb. The berries are white. It sworth cultivating for the elegance of its foliage and the brilliancy of its flowers. It should be grown in a mixture of peat, loam, and sand. Cuttings will probably root in the ordinary way
2880. Juanulld \(a\) is an epiphytal plant, and flourishes freely if planted in vegetable earth and kept in a moist warm tove. It recommends itself both by its handsome foliage and its large richly coloured calyx.
2881. Leiánthus is a genus founded on the Lisiánthus longifolius. The species are interesting plants, and will grow n a shady part of a greentouse or stove, where they will flower very profusely.
2882 Whitleya is a strong coarse-growing plant, with something of the habit of Bellardonna, and smelling like tobacco when bruised. It is of the most easy culture, and will grow in any soil, but requires a dry situation. It is incrensed ther by division or seed.
2883. Physochlaína is a genus of desirable hardy plants, being early flowerers, and elegant when in blossom. They

will grow in any soil, and are increased by division. These plants are well adapted for decorating flower-borders early in spring.
18486. Pharbultis cathártica. It is stated that M Bauduit, a rich proprietor of St. Domingo (Fl. med. des Antilles), discovered in this milky plant a resinous juice, which coagulates, and proves to be profoundly purgative. He formed of it a \(m\) ich approved syrup, which in the French colonies bears his name. The culture and propagation are the same as those for Ipomacia.
2885. Exogonium purga. The root of this plant is the true jalap of commerce. Its cultivation and propagation are the same as for the tuberous-rooted species of Ipome' \(a\).

18484 Climbing, Lvs cordate acum, entire or 3-lobed pilose, Cymes many-flwrd capitate, Sepals and Bracts lin. pilose 18485 Stem fruticose warted, Leaves roundish cordate acuminate villous, Peduncles many-flowered, Calyx villous 18486 Clinbing glabrous, Leaves cordate or cordately 3-lobed, Peduncles 1-3-flowered, Bracts lanceolate
\(\beta\) Flower rose-coloured
18487 Stem hairy, Lvs cordate entire angular or 3-lobed acuminate pilose, Pedun. solitary 1-fowered, Sep. hispid linear 18488 Climbing, Lvs hastate tripartite glabrous glaucescent beneath, Peduncles 3-4-llowered, Sepals obtuse glabrous, Limb of Corolla obsoletely 10 -lobed
18489 Downy scabrous, Lvs oblong cordate on long petioles, Cymes pedunculate dense-flowered, Sepals oblong obtuse

18400 Lvs cordate acum. entire glabr., Pedun. 2-3-flowered, Tube of Cor. long, Limb spreading, Lobes emarginate

18491 Lvs ovate cordate angular or somewhat 5 -lobed, Rac. compound contracted, Sepals acum., Root fusiform red
18492 Lvs ovate clothed with fine brown silky hairs underneath, Flowers cymosely panicled
18493 Tomentose cinereous, Lvs ovate-elliptic obtuse clothed with velvety down especially beneath, Cyme many-flwd 18494 Lvs ovate-oblong smooth above and clothed with silky down beneath, Peduncles corymbosely many-flowered 18495 Tomentose, Los large cord. glab. above clothed with silky down and nerved beneath. Flws umbellately capitate 18496 Hairy, Lvs cord. acum. glabr. above and clothed with adpressed strigæ beneath, Ped. corymbosely many-flwd

18497 Lvs cordate roundish, Peduncles l-fowered rarely 2-4 flowered, Sepals roundish, Corolla inflato-cylindrical 18458 Lvs orbicularly cordate, Peduncles elongated spicately panicled, Sepals ovate-lanceolate obtuse, Corolla narrow tubular
18499 Lvs 3-lobed, Racemes forked, Flowers secund erect

\section*{[Flowers umbellate}

18500 Lvs' on long petioles very variable in form some cord. some sagittate others hastate, lower ones deeply angular,
[Calyx reflexed, Appendages crenulated convolute 18501 Lvs pinnatifid Iyrate, Segs short obtuse 2-3-lobed and entire, upper ones 3-lobed, Peduncles l-flwd, Sinuses of 18502 Pubescent, Lvs oblong hastate, Lobes angular, Peduncles angular 1-Awd, Bracts ovate ciliated with reflexed
[wards, Stamens not exserted
18503 Lfits 3 pair, Upper pair narrow ovate acum. oblique at base, Lower pair stipule-formed reniform acum. down18504 Lats obovate ciliated at base, Segments of Calyx lanceolate ciliated, Stamens much exserted

18505 Plant hairy and viscid all over, Les spiny dark green cut into sharp segments, Flws among bracts and calyx lobes in close spiny heads

and Miscellaneous Particzelars.
288f. Batàtrs. Most of the tuberous-rooted species under the genus Ipomee' \(a\) belong to this genus: as, I. paniculàta, tuberòsa, Jalàpa, bonariénsis, \&c.
\(2 * 87\). Rivea. 'To this genus belongs the Ipome' \(a\) bдna-nox, No. 2227. The species are showy. They may be trained upon rafters or trellis-work in a stove. A light soil suits them best, and cuttings root freely in the ordinary way.
2888. Mina. This plant is cultivated by the Mexicans for purposes ol decoration. The flowers are racemose, erect, and arranged in the scorpioid manner of Borage; at first they are crimson, but change through orange to pale yellow. It is a half-hardy annual, and only requires the treatment of purple convolvulus.
2889. Calbora comes very close to Mina, and requires the treatment of the half-hardy woody specifs of Ipomal \(a\).

\(\beta\) Leaves narrow lanceolate mucronate
18530 Lvs long lanceolate acute spiny-toothed on short petioles, Racemes drooping, Berry usually 2-seeded
18531 Lvs elliptic-oblong acuminate downy, Corymbs erect, Tube of Cor, a little longer than calyx, Follicles cohering
[obovate, Follicles hairy
18532 Lrs ovate or oblong auriculately cordate, Racemes lateral elongated many-flwd, Cor. villous, Segments of limb 18533 Clothed with velvety down, Lvs ovate mucronate, Rac. simple axill., Lbs of Calyx triang- hairy, Cor. glabrous
\(\beta\) Flowers smaller sulphur-coloured, with a red tube and rose-coloured eye
18534 Bran. downy, Lvs ovate-obl. glab. above downy ben., Racemes axill. a little hispid 10-12-flwd, Pedun. downy 18535 Lvs roundish poiated covered with rusty down, Racemes 6-8-flowered, Segments of Corolla curled

18536 Hairy, Lvs elliptic acuminate, Cymes terminal, Segments of Corolla oblique ensiform, Nectary cup-shaped 5-toothed

18537 Lvs membranous cordate-oblong glabrous beneath, Stipules pectinate, Racemes secund axillary many-flwd

and Miscellaneous Particulars.
2894. Mandevilla. This plant was first sent to this counlry under the name Chili jasmine; a name which bas been given to it from its snowy white sweet-scented flowers, which from their large size and colour are beautiful to look upon. The plant is well fitted for training up trellis-work or rafters in a conservatory or on a wall The young shoots should be trained to the utmost length, as it is always near the ends of the shoots where it blooms. The shoots should be cut back in the same manner as vines in winter, or other plents which bear their fruit or flowers upon the wood of the same year. It is readily increased by cuttings.

 History, Use, Propagation, Cullure,
2895. Roupéllia. This is a handsome fragrant plant noticed by Afzelius (Report, 1794, p. 113. No. 7.) as the Cream fruit, so called from the use formerly made of the cream-like juice of the fruit. The flowers are large, white tinged with rose colour, the corona is red. It is a pretty stove plant well suited to train on a trellis, pillar, or rafters; or to be grown in a not and the plant supported by a wire trellis. Good fresh loam mixed with a little leaf mould suits it well It is a fast grower and requires water freely during summer, but care must be taken that the soil does not become stagnant. It is readily increased by cuttings,
2896. Dipladenia. The species are either scandent or erect shrubs, with opposite entire leaves, and many bristles or glands in place of stipules. The genus differs principally from Echites in the number of nectareous glands. The flowers are very showy, usually rose-coloured, pink, or purple. They thrive best in equal parts of light rich loam, heath mould, and very coarse sand. They may be trained to rafters or wire trellis in a stove. They are readily increased by cuttings.
2897. Rhynchospermum. This is a pretty climbing shrub, with the habit of a simple-leaved species of Jasmine. It is well fitted for training on rafters or trellis-work. It is of easy culture, and is readily propagated by cuttings.
2898. Parsónsia. The species are cultivated like other green-house climbers. A mixture of loam, sand, and peat suits them best.
2899. Lyónsia. This is a pretty greenhouse climber, with sweet-scented flowers. It is well adapted for training on rafters. The same soil recommended for Parsónsia will suit it.
290.). Adènium Hónghel is a curious plant. It forms one or two fleshy stems like those of Plumièria, on the top of a club-shaped protuberant root or base of stem; and these stems divide again into dumpy branches, each bearing two or three leaves only. It appears to be of very slow growth. Its flowers are very handsome and rose-coloured. According to Alph. Decandolle this shrub is fouid in dry places in Wallo and Senegambia, where it is commonly called Honghel. It requires a dry stove where it can be fully exposed to the sun. Being a plant of slow growth, it does not require much water at any time, and it should be kept almost dry after the leaves have fallen.
420. Cérbera Tinghin is the Ordeal tree of Madagascar. When the late queen of Madagascar, in the beginning o 1830, came to the resolution of clearing her land from sorcerers, an ordeal was commanded in every town and village.

18538 Lvs smooth oblong-elliptic acuminate, Cymes terminal sessile 6-8-flowered, Bracts keeled
18539 Root tuberous, Stems annual, Leaves obovate rounded downy, Flowers 3.4 together terminal 18540 Glabrous erect, Leaves oblong-ovate taper-pointed, Racemes loose drooping 4.6-flowered 18541 Glabrous, Root round, Leaves ovate-oblong acute, Racemes terminal one-sided, Sepals very narrow 18542 Leaves elliptic acuminated undulated cordate downy beneath, Racemes axillary
18543 Glabrous, Stem and Branches swollen at the joints, Lvs lanceolate acuminate, Racemes axillary usually 6 -fiwd 18544 Glabrous, Leaves ovate acute, Peduncles axillary 2-flowered, Sepals narrow, Lobes of Corolla triangular curled

18545 Rooting like ivy, Young Branches downy, Leaves oval deep green glabrous with minute scale-like glands in place of stipules, Flowers corymbose
[Corolla urce-late
18546 Stem downy, Lvs downy wavy variable in form from linear to obovate, Flws in close one-sided naked panicles, 18547 Stem downy, Leaves shining from linear to obovate, Panicles short one-sided, Corolla campanulate

18548 Leaves opposite, Cymes terminal trichotomous, Limbs of Corolla bearded: differs from Parsonsia in the fruit being a capsule

18549 Leaves oblong-elliptic abruptly acuminated, Peduncles loosely 3 -flowered, Corolla with a very Iong tube
18550 Leaves oblong obtuse coriaceous, Cymes elongated dichotomous, Calycine Segments obtuse, Segments of Corolla oblong falcate
18551 Leaves obovate-oblong glabrous obtuse mucronate, Bracts narrow, Pedicels villous, Calyx downy, Lobes of Corolla obovate

18552 Leaves elliptic lanceolate approximate coriaceous shining, Corymbs terminal panicled

18553 Leaves serrulated, Panicle terminal, Flowers sweet-scented

18554 Fleshy, Lvs alternate entire, Flws pedicellate in single or branched spikes, Spikes few-flowered, Bracts remote

18555 Glabrous, Leaves obovate acuminate coarsely crenated, Corymbs lateral leafy from large bracts, Segments of Cbrolla linear, Anthers combined winged and tailed
18556 Leaves membraneous. Petioles tumid at base and articulated with the stem, Flowers spicate

and Miscellaneous Particulars.
and at Tannanarivoo scarcely any class of inhabitants escaped. On the 9th of May, 1830, in compkiance with the sovereign's mandate, a notable administration of the Tanghin took place. The accused persons amounted to about thirty, including some of the highest. All the nobility recovered; while the unknown plebeians, who, according to the common jugglery had been compelled with them, died. The former made the usual triumphant entry into town, on the 17th, borne in open palanquins, amongst the shouting, dancing, and grimaces of the many thousands of people. In the following month, April, about an equal number of Malagassy ladies submitted to the same ordeal, but all survived, and, in due course, made a grand entry into town. The Tanghin is administered in private as well as in public. A subject so deeply rooted in the minds of all the Malagassy people, from the sovereign down to the slave, is the belief in witcheraft; and so blindly are they led by this belief, that the whole nation may be considered as under a spell as powerful as the fascination which they attribute to the unfortunate sorcerers themselves. The fruit of the Tanghin is the part used, and is administered by means of some liquid, as broth.
2901. Lacepedia insignis is a fine tree with very fragrant blossoms. It grows in any light soil, and is readily propagated by cuttings in the usual way
2902. Ullucus. The tubers of this plant are eaten in Peru. In the time of the potato panic the roots were introduced as a substitute for it, but it proved an entire failure, as the roots are worthless, and not suited to the English palate. It is called Uliuco and Melloco in Peru. The plant is cultivated for its roots throughout the elevated regions of the Andes of Peru and Bolivia under the name of Oca-quina. The tubers are chiefly used by the Indians in the preparation of Chuna, by alternately freezing and steeping them, by which they are changed into an amylaceous substance. It is a succulent herbaceous plant, growing luxuriantly in the open air during the summer and autumn. Being easily affected by frost, it is necessary to take up the tubers about the end of October, and keep in store till April, when they should be planted in the open air. The plant throws out thread-like branches, which run over the stems, or on the ground, and enter the soil, and there develope new tubers. The largest tubers grown are about the size of a hazel nut, of a rich yellowish colour, and firm waxy texture.
2403. Labisia. This curious stove plant requires to be grown in a humid atmosphere, where it may have a gentle bottom heat. In winter little water is required for weeks; if the soil is kept moist it will be all that is required.

History，Use，Propagation，Culture，
2904．Corynecárpus is a fine tree，with laurel－like leaves．It only requires the culture of an ordinary greenhouse plant，and readily increases by cuttings．
2905．Fagree a．The species of this genus are beautiful trees．They flourish in a moist stove，and succeed best with bottom heat．
2906．Habrothámnus．The species of this genus are said by Hartweg to be the gayest productions of the Mexican flora．The genus is hardly distinct from Céstrum，but，as the plants are common in the gardens under the name of Habrothimnus，we have retained the name．The species do well with the treatment of Pelargonium．
2si07．Isochroma tubulosa is a handsome half－hardy deciduous shrub．It grows freely in rich soil in the open air during summer，but it should have an abundant supply of water；and it should be taken up about the end of

18557 Leaves alternate obovate-wedge-shaped subemarginate quite entire glabrous, Panicle large terminal sessile
18558 Arboreous, Branches bluntly tetragonal, Leaves elliptic or obovate, Panicle cymose 3-6-flowered, Tube of Corolla obovate
18559 Leaves obovate-elliptic glabrous, Calyx bilabiate, Tube with 5 angular wings, Corolla with a 5 -ribbed tube widening upwards and contracted at the mouth, Lobes curled
18060 Clothed with stellate down, Filaments toothless, Leaves ovate-lanceolate nearly naked above, Spikes simple axillary pedunculate, Bracts narrow
ciduous, Limb of Corolla rellexed, Berries white 18561 Glabrous, Filaments furnished with a tooth, Leaves oval undulated, Flws sessile spicate panicled, Bracts de18562 Glabr., Lvs oval pale beneath, Flws disposed in thyrsd fastig. term. corymbs, Bracts persistent [Brcts foliac. 18.56 Lvs oval-obl-lanc. scabr. above rather tom. beneath, Lvs of buds emulating seps, Flws sess. in crowded spks, 18564 Filaments denticulate, Lvs alternate ovate undulated coriaceous shining, Racemes nearly sessile

18565 Downy, Lys ovate entire, Flws terminal cymosely capitate involucrated, Corolla urceolate with ciliated segs
18566 Glabrous, Lvs ovate-lanceolate entire, Corymbs terminal forming as it were a dense leafy panicle, Segments of Corolla lanceolate

History, Use, Propagation, Culture,
2910. Rogièra is a genus of pretty shrubs nearly allied to Rondeletia; they grow freely in a mixture of loam and leaf mould, and are readily increased by cuttings.
2911. Péntas. \(P\). carnea is a very handsome and showy plant; it grows freely in a moist heat in a mixture of leaf mould, sand, and loam, and is readily increased by division and cuttings in the ordinary way.
2912. Hindsia. The species are among the finest things obtained from Brazil. They only require the treatment of other stove plants.
2913. Higginsia mexicana. This plant was raised in the Berlin Garden from seeds that sprang up in the earth in which Mexican plants had been imported. For the summer it does very well in the open air, but it must be placed in a green-house in winter. The flowers are in axillary cymes.

18592 Lvs ovate covered with scurfy down, Stamens inserted near the orifice of the tuhe, Style short
[Corolla roundish with silky disks 18593 Branches and younger leaves silky villous, Lvs ovate subcordate smooth above and downy beneath, Lobes of [flexed, Cymes terminal corymbose many-flowered 18594 Hairy, Lvs nearly sessile ovate-lanceolate acuminate cordate at base coriaceous, Stipules ovate-lanceolate re18595 Hairy, Lvs oblong nearly sessile, Stipules large ovate, Cymes short compact terminal, Lobes of Calyx obtuse
[elongated 18596 Lvs ovate or oval-oblong acute rather pilose, Tube of Corolla much longer than the Calyx, Branches of style [middle
18597 Downy, Stipules ovate, Lvs broad-ovate, Calycine Segments very unequal, larger ones foliaceous above the 18598 Lvs ovate-lanceolate strigose beneath bearded in the axils of the veins, Panicle leafy, Branches 3 -flowered
(recurved, Berries scarlet 18599 Branches terete purple, Lvs obovate-acute nearly glabrous, Peduncles axillary 3-8-flowered, Limb of Corolla [nearly sessile 18600 Lvs approximate at tops of the branches oblong-lanceolate entire, Corymbs terminal few-flowered, Flowers
[bipartite
18601 Lps broad-obovate-elliptic nearly sessile, Flowers axillary, Lobes of Calyx lanceolate, Stamens enclosed, Stigma
\(\beta\) Flowers white. A pretty plant well adapted for bedding out in masses

and Miscellaneous Particulars.
2914. Lindènia rivalis is a plant nearly related to Augusta or Portlándia in the nature of the fruit, and Tocoyina in the form of the flower. It forms a beautiful shrub, with flowers like those of Oxyánthus.
2915. Aden 6 phora. All the species are elegant border fowers, and are therefore worth cultivating in every garden. They will grow in ordinary soil, and are increased by seeds or dividing at the root.
2916. Platycddon. These plants are neat when in blossom. They thrive best in pots in a mixture of sand, loam, and peat, and placed among alpine plants. They will also thrive in a peat border.
2917. Glossocomia ovata is a hardy perennial with spindle-shaped roots, and is inclined to twine. It grows well in common garden earth. It is readily increased from seeds treated like those of Campánula carpáticr.

History，Use，Propagation，Culture，
2920．Weigela is one of the most beautiful shrubs which have been introduced into this country for years．It is hardy and an early flowerer；it does well against a wall．It appears to be nothing but the Calyphirum floridum of Bunge． It also forms a pretty plant when grown in pots．
2921．Rhodóstoma is a small bush with cymes of white flowers，which as they decay change to red．The culture ard． propagation are the same as those recommended for Posoqueria or Gardènia．
2922．Sherbournia is a beautiful shrub when it flowers．It requires much heat and a moist atmosphere．In is s natural habitat it grows in the low lands by the sides of rivulets，where it forms a close compact leafy bush，along with Smeathmánnía pubéscens．Its culture is the same as for Gardènia．
2923．Heinsia jasminiftora is a most graceful shrub in its native place．The flowers are numerous，about the size of those of Vinca rosea．Its culture is the same as for Gardenia．In its native place it grows on the mountains in great quantities along with Smeathmúnnin lovigàta，and these two flowers form profuse sheets of white．
497．Cephaelis Ipecacuúnha．Although the root of Ipecacuanha has been long employed as a valuable article of

and Miscctlaneous 户゙articuiars.
the Materia Medica, yet the botanical character of the plant which produced it remained unknown until Professor Brotero of Coimbra determined the genus to which it ouvht to be referred, with the assistance of observations made in Brazil on living plants by Bernardo Gomez, a resident medical bntanist. The plant is a native of moist woods near Pernambuco. Bahia, Rio Janeiro, and other provinces of Brazil. It is called Ipecacuanha by the natives of some parts of Brazil, and Poain de Matto by those of the southern provinces. The root is simple, or a little branched, irregularly bent, externally brown, wrinkled by rings. It appears that a native of Brazil, whose name was Mich.el Tristan, was the first who brought Ipecacuanha into use. He speaks of it as a remedy in dysentery. Piso afterwards describes it, and speaks of two sorts, the white and brown. Besides these, the name Ipecacuanha, which, in the language of South America, means Vomit-root, is given to various species of Cynãnchum, Asclèpias, Dorstènia, Euphórbia, Viola, \&c. The black, or striated, Ipecacuanha is Psychótria emética, the white Ipecacuanha is Richarćsomia scàhra, and the common brown Ipecacuinha is Ccphaèlis Ipecacuánha.
2924. Catha is a plant of easy culture, only requiring the treatment of other hothouse shrubs.

History, Use, Propagation, Culture,
2925. Sollya. All the species are beantiful and delicate shrubs, of easy culture, with delicate blue flowers.
2926. Prondya élegans is an evergreen twining shrub from Swan Rivrr, with terminal clusters of pale lilac flowers. It has the habit of Sollya, to which it is nearly allied, but is inferior in beauty.
2927. Mariánthus. A curious and interesting twining-plant, allied to Sollya, of great beauty when in blossom.
2928. Lemonia is allied to the American monopetalous Rutaceous genera, of which the Angostura-bark tree may be taken as the type. It is a pretty shrub, and will grow well in a rich mixed soil, and cuttings will-root readily in the ordinary way.

18685 Leaves elliptic sharply serrated, Branches leafy, Flowers usually solitary
18686 Leaves ovate fringed with long toothed serratures, Flowers tetrandrous subumbellate, Capsule 2-5 winged 18687 Climbing radicant, Leaves ovate-lanceolate serrated, Peduncles filiform several times dichotomous, Petals orbicular crenulate, Capsule prickly
\(\beta\) Leaves spotted with white or yellow
\(\gamma\) Leaves variegated with white or yellow
18688 Lrs oval serrated glabrous above and downy beneath, Flowers in thyrsoid panicles, Pedlcels pilose in capitate 18689 Rather spiny, Leaves glossy deep green, Flowers clustered
18690 Leaves ovate-oblong glandularly serrated shining downy beneath, Panicles terminal raceme-formed
18691 Leaves narrow oblong obtuse downy beneath, Flowers in small roundish stalked heads [ends of small spurs 18692 Young brnchs dwny, Lvs small trunc. spiny-tooth. shining pale and pitted ben., pits hairy, Flws clustered at 18693 Brnchs warted at the nodes, Lvs rodsh-cun. glab. entire or tooth. vil. beneath, Corymbs axil. rather tubercled 18694 Brnchs covered with rusty hairs, Lvs obl. rounded coarsely-toothed revolute edges with distinct staik. glands, 18695 Rather thorny, Leaves cuneate, Umbels small axillary [Flws in term. stalked roundish clusters or umbels 18696 Leaves quite entire.
[petals
18697 Leaves oval or elliptic smooth silky white beneath, Corymbs few-flowered terminal, Stems twiggy, Flower with 18698 Leaves small oval-oblong shining above downy beneath, Flowers corymbose, Flower with petals
18699 Leaves oval-lanceolate white from down beneath, Corymbs terminal crowded, Flower with petals
18700 Leaves ovate-lanceolate downy beneath, Panicle few-flowered, Flowers apetalous
18701 Leaves ovate-lanceolate serrated scabrous from starry down above and velvety beneath, Panicles few-flowered, Flowers apetalous
18702 Leaves lanceolate glabrous above but silky villous beneath, Flowers axillary solitary, Berries silky
18703 Glabrous, Leaves ovate-lanceolate, lower ones serrated, upper ones quite entire, Cymes many-flowered nutant
18704 Young branches villous, Leaves lanceolate entire, Panicle few-flowered, Berry spindle-shaped villous
18705 Glabrous, Leaves linear entire bluntish, Cymes many-flowered nutant, Stigma nearly simple, Fruit oblong
18706 Leaves narrow oblong-lanceolate pilose beneath, Corymbs terminal, Flower pale blue, Stem erect

18707 Downy, Lower Leaves spatulate dentate or pinnate, upper ones oblong, Peduncles solitary corymbose, 3 lower Petals paler and spotted with blue
18408 Leaves nearly opposite unequal-sided coriaceous ovate-oblong bicrenate, Panicles axillary simple dichotom., Caly \(x\) enclosed in a 2-leaved involucrum
18709 Leaves petiolate trifoliate smooth, Leaflets obovate, Peduncles axillary 2-3-flowered
18710 Leaves obovate crenated netted with green veins on a pale ground beneath, Peduncles axillary solitary Iflowered, Corolla one inch long, Shrub of compact habit
18711 Leaves simple rarely bifoliate repand with appendages at the base of the petioles, Panicles terminal and lateral
18712 Leaves broad-lanceolate, Racemes compound, Peduncles glabrous, Petals obtuse

\footnotetext{
2929. Metrodorca. A pretty shrub. A good mixture of sandy loam and peat will answer it well, and it will be readily increased by cuttings in peat.
2130. Pentarhaphice is a pretty little bush with scarlet fowers. It requires the treatment of ordinary stove shrubs.
2931. Almeida rubra is a very handsome shrub with delicate rose-coloured flowers. A mixture of light loam and leaf mould suits it well. It is increased by cuttings in bottom heat.
2932. Erythrochiton. This genus is nearly allied to Galipèa that furnishes the Angostura bark. A mixture of hight loam and leaf mould will suit it.

Hislory, Use, Propagation, Culture,
2933. Corethrostylis is one of the most striking Swan River plants; but, owing to the difficulty of cultivating it, the specimens that have been produced in Europe are very inferior to the wild ones. The foliage is swert-scented. Rough peat and silver sand is the best soil known for it. It requires a liberal supply of water in summer, and as much air as possible. In winter it should be treated the same as Cape heaths, It is propagated by cuttings in the usial way.
2934. Guichendtia is a very pretty shrub, and requires the same treatment as Corethrbstylis.

\section*{18718 Leaves subverticillate obovate shining entire glaucous beneath, Umbels term. sessile few-flwd, Sepals ciliated} 18719 Leaves lanceolate mucronate coriaceous glabrous, Peduncles solitary, Capsule glabrous 2-valved 2 -seeded, Seed purple

18720 Leaves ovate-deltoid 3-nerved, Bracts 3 lanceol.-elliptic, Calycine segments glabrous inside, Ovarium 5-celled [glabrous, Pets. none 18721 Leaves small cordate 3-lobed with whitish hairs beneath, Stipules none, Racemes erect many-flowered, Style 18722 Hispid from stellate hairs, Leaves cordate subhastate sinuate obtuse, Stipules large petiolate cordate, a little 3-lobed, Racemes secund, Petals none
[tose margins glabrous. Flws very large 18723 Lvs cordate ovate obtuse entire or 3-lobed at length glabrous, Peds tomentose usually 2-flwd, Calyx tomen18724 Lvs cord. hast. 3-ibd pil. above stel. tom. ben, Stips none, Racs erect mny-fid glut., Pets none, Style pil. at base 18725 Leaves cordate lanceolate subhastate pilose stellately hispid beneath, Stipules foliaceous semicordate, Racemes flexuose many-flowered hispid, Petals none, Style glabrous

18726 Beset with stellate hairs, Leaves cordate entire, Flowers cymosely racemose opposite the leaves, Bracts leafy coloured

18740 Succulent bran. creeping, Lvs altern. renitormly cord. slightly ser., Ped. axil. solit. 1-flwd, Spur short incurved 18741 Leaves ovate serrate wrinkled, Spur straight, Peduncles 3-6-Howered, Flower small
18742 Lvs roundish cordate entire, Spur longer than the pedicel, Scapes radical bearing a raceme of long-stalked flws

18743 Pilose, Leaves radical numerous cordate-ovate, Stipules linear lanceolate fringed, Peduncles radical pilose, Spur short blunt, Petals bearded with clavate hairs inside

18744 Leaves tapering to the base obovate spatulate obtuse crenately serrate, Peduncles axillary, Lip hairy with two elevated glandular lines

18745 Pilose, Leaves obovate, Flowers glabrous axillary on the lateral branches, Tube of Calyx cylindrical 18746 Leaves linear remote smooth, Heads of Flowers terminal, Bracts silky toothed, Style pilose

18747 Hispid, Spines by threes straight, Leaves cordate 5-lobed deeply serrate downy beneath, Peduncles nutant 1-3-flowered, Sepals reflexed, Fruit hispid

18748 Erect, Branches unarmed, Leaves quite entire oval or oblong-linear fleshy convex beneath powdery, Spikes branched

18749 Strigose, Stem branched, Lvs lanceolate, Peduncles elongated, Heads globose smooth, Involucrum many-lvd, Segments of stamineous tube bicuspidate
[Sepals white
18750 Lvs lingulate oblong clothed with powdery down beneath, Rachis fiexuous, Spathes 6-7 many-flowered lanceolate,

and Miscellaneous Particulers.
2935. Schweiggèria is a pretty shrubby violet with white flowers. It will grow well in a compost of sand, lnam, and peat; and cuttings of young wood will strike root in sand. The plant requires plenty of water while growing, and should be placed in an airy situation in the hothouse.
2936. Cryptundra is a genus of neat little greenhouse shrubs, requiring about the same treatment as Cape heaths. They should be potted in a soil composed of sandy peat and a small portion of loam, with plenty of drainage. They ; are increased by cuttings of the young shoots, like Cape heaths.

History, Use, Propagation, Culture,
18751. Sarcostémma campanulàta is a pretty little greenhouse climber, well adapted for training over ornamental wirework, like most of the Asclepiadeous plants. It requires a rich loamy soil, and plenty of moisture during the growing season. When it has done flowering, water should be gradually withheld. The plants should then be cut back and repotted.
2937. Schubértia gravèlens. When Stephanotis floribunda made its appearance it was generally considered, and justly, the finest twining plant in cultivation. The present plant is not inferior to it under good culture. The flowers are rather larger and quite as fragrant. It is of easy culture.
2938. Trichosáchme is a curious woolly climbing shrub, with small flowers having long purple tails, which are analogous to those in Strophánthus. Its culture is the same as that of other hothouse climbers.
2939. Cyvóceras is very close to Hoýa in habit. It is a beautiful hothouse climber. It requires the treatment of Huýa.

\section*{DIGYNIA.}

18751 Downy, Lvs ovate-oblong acuminate cordate tomentose beneath, Peduncles many-ffwd, Corollas campanulate
18752 Villous, Lvs cordate obovate downy shining above, Umbels 6-7-flowered pilose, Segments of limb ovate

Ivs of corona short bifid, in. lig. clav. 18779 Brochs prostrate fleshy nearly leafless, rough from tubercles, Lvs very minnte ternate cord., Flws axil. sessile

and Miscellaneous Particulars.
2940. Dictyanthus. A woody climber of great beauty when in blossom. The corolla is large, urceolate be ow, and green; its limb turned back and prolonged into five long horns with recurved margins : this part is whitish marked with numerous small lines or strix of purple. The plant will grow in the open air in summer, and in a warm house in
winter. It requires the same treatment as other woody tender climbing Asclepiadeous plants.
2941. Raphistémma pulchéllum, as a climber, is nearly equal to Stcphanotis floribúnda.
2942. Stephanotis floribúnda is a graceful climbing shrub; and when trained upona wire globe trellis, with the mass of dark foliage and the countless clusters of large white flowers, is most attractive. It is a plant of easy culture, and if easily propagated by cuttings in the usual way.
2943. Oxypétalum is a genus of pretty hothouse climbers with showy blue or purple flowers. O. solanoides may be treated in the same manner as recommended for Stephandtis.

History, Use, Propagation, Culture,
2944. Wigandia. The species are straggling plants, with blue flowers, beset with stinging hairs; they are of easy culture, and cuttings will root readily. The genus comes near to Hydrolea.
2945. Xanthosia rotundifolia is one of the prettiest greenhouse plants. It grows best in rough peat, sand, and a little loam. It will grow from cuttings or best from seed.
2946. Astrótriche. Grows well with the same treatment as Xanthòsiut,
2947. Närthex asafo'tida. Dr. Falconer says that he has compared his materials with Kæmpfer's description and figures, and with the original specimens of that author in the collection in the British Museum, and found them to agree, as far as comparison could be instituted, in every essential particular. Jubbar Khan, the Dardoh rajah of the country in which Dr. Falconer gathered his specimens, at once recognised it as that which furnishes the Heeng or Asafoetida of commerce, and referred to the medicinal accounts given of it by the Persian and Arabian authors; but the Dardohs are a wild race, and do not collect the gum resin for exportation. Some young shoots were carefully removed and introduced to the Botanic Garden at Saharumpoor, but afterwards transferred to the subsidiary hill garden at Mussooree. Of these some have succeeded well, but had not fowered up to the time of Dr, Falconer leaving India; and one of these furnished the leaves which are represented in the figure in the Linnean Transactions, together with a small quantity of asafoetida, differing in no respect from the ordinary condition of that substance as

18780 Stern cylindric simple areolate, Flowers nearly sessile small aggregate, Outer series of corona 5 -cleft, Lobcbifid with teeth between
18781 Hairy, Leaves elliptic cordate doubly crenate, Spikes secund revolute, Sepals lanceolate, Stamens ciliated 18782 Hispid, Leaves ovate cordate doubly serrate pilose, Spikes unilateral scorpioid, Sepals linear -lanceolate

18783 Leaves reniformly orbicular coarsely toothed, Umbels 3-4-rayed, Umbellules many-flowered, Involucra and Involucels 3-leaved
18784 Clothed with lanuginous down, Leaves ovate-lanceolate
18785 Clothed with short adpressed down, Leaves oblong-linear coriaceous
18786 Stems floating creeping at base, Lvs bipinnate, Segments simple or pinnatifid, Leaflets wedge-shaped, Umbels opposite the leaves
18787 Downy, Stem simple furnished with leafless dilated petioles, Radical Leaves glaucous with trisected petioles and bipinnate divisions, Segments linear-lanceolate unequal-sided entire

\section*{TRIGYNIA.}

18788 Habit of \(V\). dentatum. The flowers are white in round heads, size of those of the Guclder Rose or Snowball 18789 Habit of \(\boldsymbol{V}\). dentàtum. Leaves plicate with a few rough hairs on both sides, Flowers small white 18790 Covered with stellate scurfy down, Leaves ovate obtuse denticulated, Cymes compound somewhat pyramidal

\section*{PENTAGYNIA.}

18791 Clothed with adpressed hairs, Branches slender, Leaves small lanceolate, Pedicels 1.flwd terminal and lateral, Corolla silky with crenulated edges
[terminal, Pedicels umbelliferous 18792 Unarmed, Lys petiolate 7 -nerved \(\mathbf{7}\)-lobed, adult ones glabr, young ones woolly, Lobes ovate serrated, Panicles 18793 Leaves trifoliate
18794 Leaves thick smooth, in the young plant elongated reflexed simple toothed lanceolate, in the old tree ternate, Flowers racemosely umbellate
18795 Smooth, Leaves tripinnate, Leaflets petiolate cordate oblong serrated, sometimes 3 -lobed, Unbels compound racemose
18796 Leaves oblong, Flowers disposed in cymose corymbs
[on the edges, Flower Iarge crimson 18797 Glaucous branching upwards, Lower Leaves narrow obtuse closely packed, Cauline ones ovate acute fringed

18798 J,vs oblong-lanceolate faintly nerved, Scape branched, Branches panicled, Flowers unilateral distant, Bracts large 48799 Radical Ivs obl. or obov., Scape leafless branched at top, Branches downy terete, Fascicles 4 -flwd crwdd secund 18800 Stem shrubby leafy at top, Lvs sessile large obovate-spatulate, Panicles compound, Branches of Panicle winged : 8801 Lvs glaucescent oblong 3-nerved at base, Scape stiff panicled, Branches angular, Bracts 4-flwd, Flws secund 18802 Erect brnchd, Stem compressed, Lvs spatulate glaucous dotted, Pan. lateral elon,, Spikes many-flwd, Cal. hispic 18803 Arborescent, Lys ovate obtuse narrow at the base, Panicle compound terminal, Branches of Panicle 2-edged

8804 Branches naked at base beset with old deflexed lvs, Lvs acerose the lowest flat the rest subulate trigonal, Scapes downy, Spike of 7-9 dense spikelets, Bracts crowded louger than the tube of calyx mucronate

and Miscellaneous Particulars.
occurs in commerce. The species is found, as it would appear, in the greatest abundance in the Persian provinces f Khorassan and Laar, and thence extends on the one hand into the plains of Turkistan upon the Oxus, where seems to have been met by Sir Alexander Burnes, and on the other stretches across from Beloochistan, through andahar and other provinces of Affghanistan, to the eastern side of the valley of the Indus in Astore. Dr. Falconer as not met with it in Cashmere. Besides the gum resin, the fruits of Narthex Asafoetida are also imported into adia for medicinal use, and along with them the fruits of another umbelliferous plant, which Dr. Falconer found to long to a true Fer rula, and which are sold under the name of Doogoo, a word evidently connected with the Greek rúxos. Dr. Falconer also mentions another umbelliferous fruit in the collection of Dr. Royle, labelled as the seed the wild asafœetida plant, collected and brought to England by Sir John MacNeill from Persia, which differs widely om the fruit both of Närthex and Férula, and belongs to another tribe of Umbellifera.
2948. Grammánthes is a pretty little annual plant. It requires to be grown in a pot placed in a greenhouse. It ill, perhaps, succeed on rockwork. A light sandy soil suits it best.
2949. Acantholimon glumaceum is a pretty little Alpine plant of easy culture. It should be grown in a pot filled ith a light loamy soil well drained. It is propagated by dividing the plant at the root, or by seed.

\section*{Page 236. Class VI. - Hexandria. 6 Stamens.}

\author{
Order 1. MONOGYNIA. 6 Stamens. 1 Style.
}
2950. 712d. Elisèna- Tube of Perianth short, subcylindrical, decurved: Limb reflexedly spreading. Corona cylindrical, defexed. Stamens declinate, recurved. Anthers short, incumbent, fixed by the middle. Bulb covered by thick persistent fibres.
2951. 712f. Hymenocallis. All as in Panc;atium ; but the tube is straight, angularly cylindrical. Filaments flaccid, distant on the cup. Anthers long, pendulous. 'Stigma roundish. Ovarium trigonal, 3 -celled. Seeds fleshy, oblong, green.
2952. 713a. Callipsyche. Flowers declinate. Sepals and Petals combined into a short tube, regular : Sepals boatformed, Stamens and style very long, deflexed. Filaments furnished each with a tubercle at base. Anthers versatile. Ovarium 3-celled, many-ovulate. Stigma capitate.
2953. 715a. Caliphurea. Tube of Perianth narrow, funnel-shaped, nearly straight: Limb regular, stellate. Stamens furnished with a bristle on each side. Anthers subsagittate, a little curved. Style straight. Stigma subrecurved, 3 -lobed; lower lobe a little longer. Cells of Ovarium \(2-3\)-seeded. Seeds a little quadrate.
2954. 717a. Sphcerótele. Perianth tubular: Throat naked: Limb 6-cleft, equal, erect: Segments ovate, obtuse, flat. Stamens inserted in the throat. Filaments erect. Stigma hemispheric. Ovarium trigonal, 3 -celled, many-seeded. 2955. 722a. Phenalospérmum. This genus differs from Ravenàla, 722., in the seeds in the cells being disposed in many series, obovate, subglobose, on long stiff funicles, and covered with a comose stupose aril. Stamens 6 , all perfect. 2956. 725a. Dasylirion. Flowers diœecious. Male Perianth 6-parted to the base. Stamens free. Filaments a little thickened in the middle. Anthers fixed by the back. Glands six, at the base of the stamens, similar to the rudiments of ovaria. Female flower unknown.
2957. 725b. Beschornèria. Perianth 6-parted, the bottom nectariferous: Segments conniving into a tube, but spread a little at top. Stamens inserted in the bottom of the perianth, subulate. Ovarium subclavate, bluntly hexagonal, 3 -celled, the top free, conical, 3 -furrowed. Seeds few, 2 -rows in each cell. Style trisulcate, triangular. Stigma same thickness as the style, obtuse, papillose.
2958. 726a. Acanthóstachys. Perianth 6-parted, inner 3 petaloid. Stamens 6, exterior 3 epigynous, and interior 3 epipetalous. Ovarium 3 -celled, flatly trigonal : Cells biovulate. Style filiform. Stigma funnel-shaped, 3 -loied, minutely fringed. Berry triquetrous, 3-celled: Cells 2 -seeded.
2959. 728a. Piya. Perianth 6-parted: Segments convolute. Stamens subulate. Style filiform. Stigmas 3, linear, spirally twisted. Capsule cartilaginous, trigonal, 3 -celled, 3 -valved. Seeds numerous, compressed, margined.
2960. 729a. Vrièsia. Perianth 6-parted: outer 3 convolute, equal; inner 3 petaloid, revolute at apex. Scales 2 to each petal. Stamens \(6 ; 3\) of which are free, the other 3 connate at the base. Ovarium half-inferior. Stigma 3 -lobed: Lobes convolute and sinuated, villous.
2961. 729b. Fchmèc. Bractea cup-shaped. Perianth 6-parted,'spirally convolute : outer 3 like a calyX ; inner 3 petaloid. Stamens filiform, adnate to the petals. Berry ovate, globose, 3 -celled, many-seeded. Style filiform. Stigmas 2-3, linear, petaloid.
2962. 731a. Phadranássı. Perianth tubular, pendulous: Tube 6-furrowed : Segments spatulate, convolute Stamens exserted. Filaments flattened, upper 3 the shortest. Anthers versatile. Style straight. Stigma clavate, simple. Ovarium trigonal, oblong, constricted at top, 3-celled, many-seeded.
2963. 736a. Gastronema. Filaments inserted in the tube, 3 of which are declinate and twisted, and the 3 lower ones straight, conniving at top. Tube of Corolla curved, cylindrical below, and ventricose above. Ovarium oval.
2954. 739a. Phycélla. Spathe 2-valved. Corolla tubular, 6-parted, convolutely closed, campanulately subringent. Filaments inserted in the base of the segments, declinate: exterior ones stretched out into two subulate processes. Anthers ovate, versatile. Ovarium trigonal, 3 -celled, biseriately many-seeded. Style filiform, declinate. Stigma simple. Seeds membranous.
2965. 739b. Callithadma. Perianth 6-parted: Tube slender, cylindrical, nearly horizontal. Corona 12-lobed, funnel-shaped: limb spreading a little. Filaments short, conniving, inserted into the side of the corona. Stigma obtuse.
2966. 739c. Sprekelia. Perianth declinate, annular at base, with a very short or scarcely with any tube. Stamens fasicled, declinate, clasped by lower lip.
2967. 739d. Ixiolirion. Perianth 6-parted, narrowly funnel-shaped: Segments reflexedly spreading. Stamens straight. Anthers fixed by the base, erect. Style straight. Capsule oblong, chartaceous, scarcely operculate. Seeds black.
2968. 739e. Lycdris. All as in Amaryllis, but having the tube declinate, widened towards the throat, and the filaments combined into a tube with the segments of the perianth, 3 of which are declinate and twisted, and the 3 lower ones straight, conniving at top.

History, Use, Propagation, Culture,
2560. Coburghia. The species will grow in a rich alluvial soil with a little rotten manure, and they appear \(t\) dislike sunshine and fine weather. 'lhey stand out of doors all the summer and autumn, and on the approach \(c\)
2969. 739f. Collània. Perianth subcylindrical, 6-parted. Sepals and Petals unlike, forming themselves into a tube. Stamens and Style straight. Ovarium turbinate, operculate, glandular at top. Pericarp opercular, pulpy. Pulps edible.

2970, 748a. Bomaria. Perianth 6-parted. Sepals and Petals of a different form. Petaline filaments earliest. Capsule obtusely trigonal dehiscing at top.
2971. 758c\&. Atáccia. Perigone 6-parted: inner segments large, reflexed. Stamens inserted in base of segments. Filaments broad, concave above. Anthers 2-celled: Cells free. Stigina capitate, 3-lobed. Berry 3-celled, manyseeded. Seeds lunate.
2972. 765a. Cyanotis. Flowers nearly regular. Sepals 6 : exterior ones nearly equal, navicular, connate at base, persistent ; interior 3 longer, petaloid, connate by the claws, caducous, Stamens nearly equal, adhering to the tube, very long. Capsule trigonal, 3 -celled, membranous, 3 -valved: Valves septiferous in the middle. Ovula twin in the cells.
2973. 7656. Therèsia. Perianth bell-shaped, 6-parted. Sepals oblong, coloured, furnished with a nectariferous cavity inside. Stamens hypogynous, enclosed. Style slender. Stigma hardly distinguishable. Ovarium 5-celled, many-seeded, 5 -angled, columnar.
2974. 774b. Cordyline. Perianth 6-cleft, equal, deciduous. Filaments glabrous, inserted in the throat of perianth. Stigma small, 3-lobed. Berry globose, 3 -celled. Seeds many, strophiolate.
2975. 774c. Spironëma. Perianth 6.cleft, the 3 petaloid segments enclosed. Stamens hypogynous. Filaments spiral. Anthers cordate, petaloid, bearing a cell at the base of each lobe. Stigma papillose. Ovarium 3 -celled, fewseeded. Ovula horizontal.
2976. 788a. Luzuriàga. Corolla 6-petaled. Petals distinct, equal: 3 outer ones narrow. Stamens inserted in the receptacle. Anthers erect, sagittate. Style triquetrous. Stigma triangular. Berry triangular, with a membranous dissepiment. Seeds 2 in each cell from abortion.
2977. 788b. Callixene. Corolla deeply 6-parted, equal, alternate segments glandular at base. Stamens dilated at base. Anthers versatile. Stigma trigonal. Berry small, 3 -celled. Cells pulpy inside, usually 3 -seeded.
2978. 788c. Philèsia. Perianth campanulate, 6 -parted, regular: 3 outer segments acuminate; 3 inner ones twice as long, obtuse. Stamens connate at the base. Anthers long, versatile. Stigma 3-lobed. Berry subtrigonal, 3-celled, many-seeded
2979. 789a. Lapagèria. Perianth 6-leaved, campanulately conniving : outer leaves carinated ; inner ones broader, subunguiculate. Stamens subulate. Anthers fixed by their base. Ovarium l-celled, with 3 parietal placentas. Ovula numerous, mucous. Stigma clavate, oval-oblong. Berry l-celled, many-seeded. Seeds obovate, truncate, nestling in pulp.
2980. 789\%. Ripígonum. Perianth 6-parted, equal, spreading, bibracteate, deciduous. Stamens subulate, glabrons

Anthers longer, emarginate, inserted by their base. Ovarium 3 -celled: cells 1 -seeded. Style short. Stigma 3 -lobed, obtuse. Berry 1-2-seeded. Seeds subglabrous.
2981. 808a. Bidwillia. This genus differs from Asphódelus in the filaments being clavate above.
2982. 809a. Simethis. Perianth of 6 spreading \(5-7\)-nerved segments. Filaments woolly at apex. Capsule globose, 3-lobed, 3-celled, 6-seeded.
2983. 809b. Echeáudia. Perianth 6-parted. Sepals all more or less twisted and rolled back. Filaments enlarging outwards. Style filiform. Capsule triangular, roundish, oblong, 3-celled. Cells many-seeded.
2984. 813a. Chrysobactron, Flowers racemose, sometimes diocious. Perianth 6-leaved. Anthers versatile. Ovarium 3-furrowed, Female flowers as in the male, but the anthers are incomplete. Capsule ovate, 3 -celled, 3 -valved. Cells usually 2 -seeded. Style strong. Stigma capitate, 3-6-lobed. Anthers closely connected together.
2985. 817a. Drimmiópsis. Perianth green, campanulate, nearly equal. Stamens equal, epipetalous. Ovarium tapering into the style. Ovula twin, collateral.
2986. 821a. Bellevúllia. Perianth campanulate, 6-parted. Stamens exserted or enclosed. Capsule membranous, triangular, 3-celled, 3-valved. Cells 2.seeded. Stigma obtuse entire.
2987. 2590a. Isómeris. Sepals united at base. Petals 4, oblong, sessile, nearly regular. Torus fleshy, dilated above. Stamens equal, much exserted. Capsule large, obovate-elliptic, indated, coriaceous, indehiscent, stipitate. Seeds numerous, large.
2988. 836a. Anópteris. Calyx 6-lobed. Petals 6. Stigma bifid. Capsule l-celled, 2-valved. Seeds compressed, furnished with a wing at top.
2989. 836b, Eleutherine. Stamens free. Style trifid at apex. Capsule 3-celled, dehiscent at top, chartaceous. Seeds wrinkled, roundish. Perianth fugacious, regular.
2990. 836c. Prepùsa. Calyx large, 6-winged, 6-cleft, coloured. Corolla campanulate, 6-cleft, with a swollen tube and a naked throat. Stamens as if they were emerging from the duplicatures of the corolla. Stigma bilamellate. Capsule l-celled, 2-valved, many-seeded. Margins of valves inflexed, placentiferous. Seeds uearly globose, many-seeded.
2991. 836d. Trimèzia. Perianth very unequal: Claws of sepaline segments broad, the lamina spreading; of the petaline segments narrower, incurved, the lamina recurved. Stamens filiform, spiral, inserted in the papillæ of the disk. Anthers and Lobes of Style cohering firmly. Style linear, 3-lobed at apex: Lobes lamina-formed cucullate. Stigma soft, 2 -lobed: Lobes bifarious. Seeds glabrous, bay-coloured, roundish, with a hard testa.

\section*{MONOGYNIA.}

History, Use, Propag lion, Cullure,
2950. Elisèna longipétala will grow best in white sand with a small admixture of loam. It would probably surceed in a bed of white sand out of dours, if it can be kept from shooting too early in spring.
2951. Hymenocállis. The flowers of H. Borkiàna smell like Vanilla.
2952. Callipsyche. This bulb should be potted in sandy loam and leaf mould. In summer, while growing, it requires to be kept in a temperature of \(75^{\circ}\) or \(80^{\circ}\) by day and shaded in sunny weather. In autumn, when the leaves die, it should be kept in a warm greenhouse quite dry for a few weeks. As soon as the bulb begins to shoot it should again be watered and placed in more heat. it is a beautiful plant when in blossom.
2953. Caliphrrea. This genus is very nearly allied to Eurycles and requires the same treatment. Amariglis; that is, to be kept dry when in a dormant state, and plenty of water given to them while growing.

\section*{18813 Scape 2-edged about 6-fowered, Limb of Perianth revolute, Teeth of Corona irregularly trifid}

18815 Leaves petiolate costate 1 foot, Scape 5 inches, Spathe 6 -fiowered, Corona narrow toothed, Tube slender
18816 Scape 2-edgd, Spathe 8-fiwd, Lvs green, Corona long cylind. which gives it a hose in hose appearance
18817 Scape compressed glaucous, Corona with small teeth, Leaves 3 subpetivlate an inch broad linear
18818 Scape 2-edged 10-12-flowered longer than leaves, Leaves linear-oblong streaked, Segments of Perianth linearlanceolate, Corona spreading closely toothed
18819 Leaves erect acuminated lorate, Scape 2-edged, Umbel many-flowered, Flowers sessile, Tube 6 inches long, Corona obconical free bluntly toothed between the stamens
18820 Leaves few green 4 inches wide, Scape 10 -flowered glaucous, Stamens very long incurved
18821 Leaves stiff ensiform shorter than scape, Tube of Perianth equal to limb, Corona truncate toothless emarginate, Umbels dense, Pedicels articulated, outer ones the longest
18822 Bulb ovate, Leaves petiolate depressed ovate subplicate green, Scape nearly terete glaucous, Umbels 7 -flowered
18823 Scape glaucescent 5-flowered, Peduncles short umbellate, Style and Stamens exserted
18824 Lvs obov.-obl. 3-nerved, Umbel 6-fiwd, Seg. of Per. obl. erect, Stam. exserted, Teeth of Corona obt. undivided 18825 Lvs ligul, with revol. edges, Umbel 2-flwd, Flws pendul., Seg. of Per. ovate, Stams enclosed, Corona toothless, 18826 Leaves with rolled-back edges, Flowers pendulous, Corona toothless
[Fils 2-3-toothed, Style exserted
18827 Corona acutely cut, Filaments wiry setose, Anthers exceeding the limb
18828 Leaves oblong, Umbel few flowered, Lateral teeth of Filaments divided
[bristles, Anthers mutic
18829 Leaves equitant linear filcate covered with stellate tomentum, Panicles much branched clothed with rufous 18830 Stem tall ter. pan. clthd with hoary tom. below, Lvs lin. stiff strght glabr., Pan. clthd with purp.tom., Anth. mut. 18831 Stem angul., Lvs equit. lin. subfalc. glabr., Spks sec., Pan. clthd with pluin. brwnsh hairs, Per. tom., Anths apic. 18832 Rhizoma scaly cormoid, Leaves falcate smoothish much shorter than simple woolly scape, Racemes secund elongated, Limb of Perianth erect, Anthers mutic
18833 Caudex short divided covered by the vestiges of the old leaves, Leaves narrow keeled glaucous spiny serrated, Scape shorter than leaves, Perianth glabrous, Filaments broad truncate
18834 Caudex short, Leaves linear acuminated imbricate with broad stem-clasping bases finely spiny-serrated on margin and keel recurved, Scape and Ovaria tubercled, Filaments broad bifid
18835 Leaves large resembling those of Urània or Missa, Stems tall, Spathes or Bracts many-flowered

18836 Leaves linear-oblong acuminate unarmed glaucescent with the margins callously ciliated scabrous beneath
18837 Leaves long narrow spiny-serrate green
18838 Leaves narrow glaucous spiny-serrated ending in a tuft of hairs or fibres

18839 Leaves radical linear channelled recurved spinosely denticulate, Scapes erect long eimple, Flowers nutant fascicled bracteate, Fascicles remote secund
18840 Leaves radical thick broad-lanceolate smooth but scabrous to the touch beneath cartilaginously annulated, Scapes tall racemosely subpanicled, Bracts large red, Flowers nutant fascicled pedunculate
18841 Leaves long scurfy curved spiny-toothed with a long bristle-shaped point, Spike globose nearly sessile, Bracts oblong serrulate mucronate mealy, Sepals narrow
[Scape simple long scurfy, Bracts coloured 18842 Leaves radical very long incurved narrow thick pungent channelled spiny-toothed covered with white scurf,

and Miscellancuus Pariculars.
2955. Phenakospermum. This is a noble plant growing in moist shady places in Guiana, and north of Brazil, as in Maranham and Para. It is of as easy culture as Müsa or Heliconia. It is propagated by division. It will require plenty of moisture and heat.
2956. Dasylirion. The species of Dasylirion require the same treatment as the more tender species of Yucca.
2957. Beschornèria. The cultivation of the species of this genus is the same as that for Fourcréa or Agave. They are tall handsome plants, with green drooping flowers and coloured bracts.
2958. Acanthostachys requires the same treatment as Agdve or Littee'a. The plaut is from the southern part of Brazil, and is covered with a white scurf. The bracts are large and bright red. The flowers are sulphur colour. It requires a heat of from \(58^{\circ}\) to \(60^{\circ}\). A soil composed of equal parts of sand and decayed leaves seems most agreeable to it. The leaves are all radical and keeled.

History, Use, Propagation, C'ulture,
2959. Pbya is a genus of pretty plants. They have much of the habit of the pineapple. They are half-epiphytal, and will grow in the poorest situations, as on stones or wood. They succeed well with the same kind of treatment as epiphytal orchideous plants.

2y60. Vriesia. This genus is nearly allied to Tillandsia. The species will grow suspended by a piece of wire from a beam in an orchidaceous house, or they may be suspended in a wire basket. The bracts of all are of a beautiful red colour. In fact they require the sane kind of culture as the tropical epiphytal Orchidea. When potted

18843 Lvs entire smooth reddish underneath, Rac. 6 inches long one-sided, F1. 2 inches long of a deep vermilion
18844 Lvs spiny at base mealy beneath, Hac. dense, Bracts large smth, Pets 2 round. conc. with cren. scale at base
18845 Lvs lanc. sinth spiny-tthd at base, Scape cvd with fine wool as well as bracts, Spike 3 in. long, Flws 2 in. long 18846 Stm lfy finely tom., Lys long lanc. quite ent. glab. naked shing, Shths tom., Rac. term. pyr., Pets naked at base 18847 Lvs lin. long entire dil. at base spiny cil. glab., Scape bracteate simple vill., Bracts villous, Pets naked

Spike rad. capit.bract., Brcts hairy, Pets with scale 18849 Lvs ensif. keel. scurfy ben, spiny-ser. above, Scape simple, Ped. and Cal. mealy, Sep. obt., Pet. lin. with ser, scale 18850 Lvs lanc. ent. cusp. glab. ab. powd. ben., Scape simp. scaly powd., Scales lanc. ent., Rac. elong. simp., Pet. nak. 18851 Lvs ensiform acuminated downy outside at base, Racemu slender panicled, Flowers minute, Petals lanceolate naked at base acute

18852 Lvs ensiform membranous unarmed glabrous undulated distich, Peduncle short sheathed by bracts, Bracts convolute purple, Spike simple
\(\beta\) Stem 5-6 feet, Leaves 3 times longer than the spike
18853 Lvs broad thin ribbed rather glauc., Spike long cone-shaped, Bracts crimson tipped with green, Cor. 2 in. long 18854 Ps.-bulb., First Lvs dil. at base nar. upw. spiny ser., secondary lanc. unarmed pruin., Sp. sess. imb., Br. wool. 18855 Pseudo-bulb. stemless, Lvs of two forms like those of P. heterophýlla, longer than the spks, Sep. lin. lanc. keeled 18856 Stem simp. tall scaly powd., Lvs quite ent. dentic. at top powd. ben., Sp. term., Br. imbr. rose-cld, Fl. ses. rec 18857 Lvs linear taper-pointed spiny-toothed smoothish, Scape panicled, Bracts oblong concave, Petals obtuse blus

18858 Lvs acum. distantly spinose glab., Scales of tomen. scape acum. ent., Spike elong. dense-flowered, Bracts acute
[distich usually coloured
18859 Leaves few broad at base and sheathing around the bulb terete convolute, Spikes branched bracteate, Bracts 18860 Scape shorter than the leaves, Spike simple leafy at base, Bracts greenish purple lepidated
18861 Scape higher than the leaves, Spike leafless branched, Bracts naked scarlet distich keeled uncinate at top 18862 Scape shorter than the leaves, Spike branched, Bracts foliaceous scarlet naked, lower ones longer than spike

18863 Scape sessile among the lvs, Spike nearly simple leafless, Bracts green coriaceous ventricose loosely lepidated 18864 Leaves oblong-lanceolate quite entire, Spike many-fwd a little branched pendulous, Flws sessile, Bracts small 18865 Lepidoted, Leaves ovate-lanceolate channelled, outer ones recurved sheathing the scape, Bracts lanceolate acuminated at base and green at top

18866 Leaves strap-shaped obtuse mucronate spinosely dentate tipped with blood-red, Bracts broad-oval imbricate obtuse concave, Spike capitate subsessile
18867 Closely allied to B. nudicafulis, but the Petals are obt., the Spines green not black and the Lvs narrower green 18868 Lys ligul. dp grn acum. spiny-tthd, Pan. many-fiwd, Flor. Brets ov.-mucr. rose-cld, as well as calyx, Cor. exsert. 18869 Leaves channelled spiny-toothed recurved ventricose at base, Spike conical many-ranked mealy, Bracts roundish acuminate imbricate
[red scales, Bracts coloured, Racs secund, Flws fascicled, Petals revolute 18870 Leaves ligulate channelled banded with white with a few spiny teeth near base, Stem smooth with large loose 18871 Lvs erect brd lig. obt. conc. spiny serr., Spathe ov.-lanc., Sple thyrs. almst without brcts, Flws dense, Pets obt. 18872 Leaves lanceolate acuminate spiny-toothed, Scape branched naked below the flowers, Bracts lanceolate quite entire red
[gated scarlet, Bracts coloured
18873 Leaves broad-oblong mucronate channelled entire glabrous crossed by black baads, Scape scaly, Spike elon18874 Leaves long subul. glauc. or mealy, Scape brnchd at top with distich branches and bracts forming spikes, lower 18875 Leaves oblong acute dilated at the base, Sepals a little shorter than corolla, Stamens exserted
[bracts cld
[coloured, Partial Bracts and Calyxes ending in a spine 18876 Leaves ligulate spiny ciliated convolute at base, Racemes spicate, Flowers sessile glomerate, Bracts leafy 18877 Lvs clasping each other at base swrd-shpd spiny-serrul., Spks short stout a little brnchd with rich scarlet stlk, 18878 Lvs ligulate convolute at base spiny-serrate, Racemes spicate, Flowers pale pink [Flws scarlet, blue at top
18879 Leaves ligulate striated obscurely banded serrulated of a different colour beneath, Bracts lanceolate, Flowers sessile in the panicle
[filiform, Segments of Perianth linear, Stamens exserted 18880 Lvs broad undul. sheath red at base obscurely spotted, Umbel many-flowered, Spathe of 3-6 acute valves, Bracts 18881 Lvs broad undul. glabr., Scape compr. dot. at base as well as peti., Umb. many-flwd hemisph., Segs of Per. lin.

and Miscellaneous Particulars.
it should be in leaf mould, and the pots should be well drained with potsherds. Water should be given plentifully in the summer months, but sparingly in winter.
2961. Achmea. A genus composed of epiphytal pineapple-like plants with long racemes or spikes of scarlet or red flowers, and large scarlet or red bracts which last give splendour to the plants. They succeed well with the same treatment as tropical epiphytal Orchidea. They will grow on blocks of wood, in baskets, or in pots well drained with potsherds, in leaf mould. They require plenty of heat and moisture when in a growing state.

History, Use, Propagation, Culture,
2962. Phadranássa. This is a splendid bulb with cylindrical, fleshy, rather fistular scapes, and broad green petiolate leaves. The flowers are ahout 6 in an umbel, and are pendulous, long and tubular, green at base and apex; the stamens protrude, and the stigma is clavate. P. chloracea grows on rocks at the village of Saragura near Loxa in Peru, at the height of 9000 feet above the level of the sea; and \(P\).obtusa in the valley of San Antonia in the province of Quito. They are both greenhouse bulbs. They require to be potted in light, rich, sandy loam; kept quite dry during the season of rest, and fully supplied with moisture when in a growing state. The flowers rise before the leaves.
2963. Gastronèma requires the same culture and treatment as Amarýlis.
2904. Phycélla. Pretty bulbs and require the same treatment as Amarýlis, to be kept dry when in a dormant state and given plenty of water while growing.
2965. Callithauma. These are bulbs with green flowers which are stated to grow in their native country as \(t+11\)

18882 Umbel about 6-flowered, Flowers drooping tubular, Leaves green acutish petiolate rising with the flower, Stamens longer than style
18883 Umbel 6-flowered, Flowers drooping, Leaves oblong petiolate, Scape terete glaucous subspiral, Stamens shorter than style

18884 Leaves flat subglaucous one fourth to three fifths of an inch broad, Spathe exceeding the peduncle, Flowers small, Sepals concave, Petals short deeply cut green with two spots reflexed at top
I8885 Leaves solitary linear spatulate obtuse green longer than the 1 -flowered stem, Spathe 2 -leaved, Flower sessile erect, Tube terete widened at throat, Segments oblong equal
\(\beta\) Leaves pale green thick, Flowers nearly sessile red marked with white afterwards deep red, Corolla campanulately funnel-shaped revolute at top
18886 Leaves obtuse, Perianth funnel-shaped, Scape 3-4-flowered
\(\beta\) Lvs an inch broad blntsh, Scape glauc. usually 2 -fiwd, Per. compressed laterally brick-col. with deeper veins
18887 Lvs strap-shaped green, Scape glaucous, Flowers in pairs erect bell-shaped the divisions separate to the base, Corona short green
18888 Lvs erect obtuse glaucescent shorter than the many-flowered scape, Umhel divaricate, Peduncles slender
[tube which is destitute of appendages in the throat 18889 Lvs lorate-lanceolate, Scape glaucous 2-flowered, Segments of perianth combined into a curved funnel-shaped
[lorate sheathed, Corolla ringent campanulate drooping
18890 Spathe 2-flowered, Upper segments of Perianth broader and recurved, lower ones narrow, Tube very short, Lvs 18891 Spathe 3 -flowered, Segms of Perianth arched, Stamens innappendiculate at the base inserted between the fringed ring of the throat, Lvs linear recurved
[than corolla, Stigma obtuse 18892 Bulb cylindrical, Lvs flat green, Scape green 2-edged, Limb of Perianth green equal to corona, Style shorter

18893 Lvs narrower, Limb of Perianth exceeding the corona, Style exceeding the Perianth, Stigma dilated somewhat 3-lobed
[lower lip clasping the stamens, Stigma 3-lobed 18894 Scape 4-flowered, Peduncles 1 inch, Spathe reddish 2 inches, Segments of Perianth striated narrow at base, the 18895 Lvs linear glaucous, Flws solitary drooping, Segms of Perianth marked with white in the middle, Petals 18896 Tube fringed, Corolla nodding with a very ringent limb, Stamens enclosed
[lanceol, recurved

18897 Lvs glaucous channelled stem furnished with leaf-formed bracts, Flowers racemosely panicled, Peduncles \(1.3-\) flwd, Corolla tubularly closed in the lower part
18898 Distinguished from \(I x\). montanum by the expanded rotate flowers

18899 Ovary subspherical, Perianth with a short tube, and linear-oblong undulated segments shorter than the stamens 18900 Flowers stalked erect funnel-shaped clavate, Segments linear-lanceolate, Stamens straight
[lucrate at base, Perianth subcylindrical, Sepals oblong, Petals spatulate 18901 Glaucous, Stem glabrous leafy, Leaves lanceolate downy beneath, Racemes umbellate terminal pendulous invo18902 Glaucous, Stem erect filiform flexuous, Lvs oblong obtuse, Flowers 1-4 pendulous cylindrical
[narrow whitish in the lower part, Stamens short declinate 18903 Lvs narrow flaccid mottled with pale blotches upon a dark green ground, Flws small pale ultramarine, Segms
[at base, appendages of throat linear acuminate, Stigma nearly simple 18904 Lvs linear green convex on back, Umbel 2-3.flwd, Perianth campanulate revolute at apex, filiments glandular
[lar erect, Sepals apiculate, Petals oblong acum., Stigma 3-parted 18905 Lvs erect glaucescent, Scape 1-flowered, Spathe tubular coloured shorter than peduncle, Perianth nearly regu18906 Lvs bluntish green, Scape a little compressed, Spathe 2-valved, Umbels 6. fid, App. of throat minutely bearded

and Miscellaneous Particulars.
Is a man, but they are actually hardly 3 feet high. In this country they scarcely attain 1 foot. This genus is closely akin to Coburghia, of which, according to Herbert, it may perhaps ultimately be found to form only a section.
2966. Spreftelia. Comprehends the Jacobea Lilies well known for their splendid ringent declinate large showy blossoms, with the stamens closely embraced by the lower lip. The species grow very well out of doors, planted close against a south wall.
2967. Ixiolirion. The plants are perfectly hardy and flower freely. Whether it will be better to take up the bulbs to be dried in summer and reset in the autumn is not yet ascertained, but it will probably not be necessary-
2968. Lycoris. Cultivated like other hardy bulbs. They require to be grown in a sheltered place.
2969. Collània. These splendid plants should be reared in a hot-bed and then removed to a cool greenhouse. The ppen border would in all probability suit them. The genus is nearly allied to Alstromeria. The roots are edible.
748. ALSTREME'RIA.

History, Use, Propagation, Culture,
2970. Bomaria. All the species will do very well out of doors in a warm sheltered situation in summer, but require protection during winter. A light dry soil suits them best. They may be propagated either by dividing the plant at the root or by seed. Being climbers they require to have something to support the stems.
2971. Atáccia. A moist warm part of a stove suits these plants. A mixture of loam and peat with plenty of water is the best soil for them. They are readily increased by offsets. They are very remarkable plants.
[cuspidate, Petals lanceolate
18907 Livs oblong obtuse narrow at base, upper ones verticillate, Peduncles of Corymbs 3-flowered, Sepals obovate 18908 A beautiful hybrid. The flws are white spotted with red or purple [ated undulated, Pet. narrow acute 18909 Glab., Lvs of invol. and bracts of peduncs similar to the lvs, Pedunc. 2-3-flwd, Sep. broad rounded crenated cili18910 Sep. obov. apic. pale purp., Lower Pet. same col. lat. pets narrower suff. with deep purp. fulv. mid. purp. br. top 18911 Peduncs 2-3-flwd, Lvs resup. 2-3-nerved dot. with white, Seps spat., Pets narrower pale rose yel. middle

History, Use, Propagation, Culture,
2974. Cordyline comes very near to Draca'na, and requires nearly the same treatment: they are fine plants.
2975. Spironema will be despised by the searcher after show plants, but by the lover of fragrant plants it will be cherished, for its smell is delicious. To be treated as any common greenhouse plant ; increased by division.
2976. Luzuriaga is a splendid plant when in blossom. It grows best in leaf mould and sand, and requires plenty of water while growing. Being a creeping radicant plant it is readily increased by cuttings.
2977. Callixene, Lapagèria, and Luzuriàga are alł climbing plants from the south of Chili; Lapayèrin from Chiloe. All three are much alike, and are probably only snecies of the same genus. Their culture is the same,
2978. Lapagèria ròsea is a twining plant, with a fascicled fleshy root, 6 ft . or more in height. The flowers are iarge, rose-coloured, and spotted with white. Requires leaf mould and sand, and shonld be traned to a suppurt.
[and ciliated at base, Leaves oblong-linear green
18937 Bulb solitary, Stem 1-flowered 2-leaved, Petals acute, inner ones broader, Filaments bearded above the base 18938 Stem 3-4-leaved, Leaves boat-shaped glaucous lying on the ground, Scape \(1 \frac{1}{2}\) inch purplish smooth, Petals pale purple pale yellow at base green outside
18939 Flowers between those of F. lutea and F. Meledgris, Leaves lanceolate green, upper ones glancous
18940 Stem l-flowered, 4-6-leaved green glaucous, Flowers pendulous greenish purple tessellated inside
18941 Leaf solitary linear-lanceolate acuminated glaucescent beneath, Scape 3-flowered, Peduncles longer than the linear acuminated bracts, Sepals acute naked, Petals bearded recurved at top
18942 Stem arborescent, Leaves ensiform acute quite entire 2 feet long stem-clasping terminal, Racemes lateral compound
18943 Leaves linear channelled acuminated marginate reflexed, Fruit usually 3 -seeded but from abortion 1-2-seeded, Panicle simple terminal erect
18944 Stem slender branched, Leaves oblong deflexed 4-6 inches long dark green, Flowers terminal and axillary panicled
\(\beta\) Leaves deep green prettily marked with yellowish green blotches
[of 3-5 toothed bracts
18945 Habit of Sansevièra, glabrous stemless, Lvs oblong-lanceolate, Panicle branched, Flws agglomerate in the axils
18946 Lvs linear obtuse, Corona 3-leaved, Leaflets of corona linear-oblong obtuse emarginate or sinuately 2-lobed, 3 or 4 times shorter than limb of calyx, Segments of calyx linear-oblong obtuse
18947 Root thick knobby, Stem bearing long narrow dull green ribbed leaves, shining above and glaucous beneath, Panicle compound, Flowers small
18948 Stem radicant, Branches tetragonal, Leaves lanceolate oblique, Peduncles 2-4-flowered, Flowers variegated drooping
18949_ Branches nodose, Leaves numerous small scale-formed entire, Flowers terminal solitary
18950 Stem round twining radicant, Leaves alternate ovate-lanceolate cuspidate nerved, Peduncles axillary solitary l-flowered, Corolla large rose-coloured spotted with white internally
18951 Branches flexuous, Leaves alternate petiolate ovate-elliptic entire acute, Flowers solitary axillary and terminal, Peduncles imbricated by scales, Corollas large
18952 Stem prickly, Branches unarmed, Leaves alternate opposite or terminal, Racemes undivided, Perianth a little longer than anthers
18953 Rhizoma radicant scandent, Lis recurved quite glabrous ensiform longer than the interrapted spicate racemes, Bracts ovate with membranous edges longer than the flowers
18954 Lvs triquetrous about equal in length to the scape, Pedicels twice as long as flowers, Sepals and Petals ovate, Cells of Anthers elongated
[oblong obtuse, Ovarium 6-wingea
18955 Lvs linear-lanceolate nerved beneath, Spathe 1-valved, Umbel bulbiferous few-flwd, Segments of Perianth ovate18956 Leaves lorate-linear acute twisted a little, Spathe 3-4-lobed, Umbel bulbiferous fastigiate, Segments of Perianth crenulated
18957 Leaves linear shorter than the scape, Umbel many-flowered, Segments of Perianth bluntish, Ovarium elliptic, Cells 6-8-ovulate
18958 Scape leafy at base, Leaves linear channelled scabrous on margins, Umbels many-fiowered, Sepals narrow oblong obtuse
[ments of Perianth erect acuminate recurved at top
18959 Stem leafy at base, Lvs subulate equal to the scapes, Umbels lax, Pedicels much longer than the spathe, Seg-
18960 Leaves lorate-linear keeled, Spathe 3-4-lobed, Umbel many-flwd compact, Segments of Perianth elliptic obt.
18961 Leaves narrow semi-terete channelled above, Spathe l-valved, Umbels about 12 -flowered, Stamens enclosed
18962 Leaves narrow flat one-half shorter than the scape, Umbels few-flowered contracted, Stamens exserted
18963 Leaves semi-cylindrical sulcate beneath with the margins and ribs ciliated, Umbel effuse, Flowers pendulous, Segments of Perianth oblong truncate concave

2979. Philèsia buxifolia is enumerated by Dr. Joseph Hooker as amongst the handsomest of the antarctic American Flora, occurring along the coast of Magellan to Valdivia. According to Mr. Lobb, who first sent it to this country in a living state, it is a plant of slow growth. In its native country it forms large masses on trunks of trees and on rocks, throwing out long slender stems which creep under the decayed bark, and over rocks that are partially covered with soil. The flowers are produced near the extremities of the branches, have a campanulate form of a deep rose-colour, and are sometimes not less in size than a common tulip. Mr. Lobb says he traced the plant from the level of the sea to the snow line of the mountains, and it flourishes more freely at this great elevation.
2980. Ripógonum. Only requires the common culture and treatment of ordinary greenhouse climbing shrubs. caruléscens G．Don．cærulleum Pall．

Histury，Use，Propagation，Culture，
2981．Bidwillia．This plant was introduced by Mr．Bidwill of Sydney．It is a native of an elevated tract of table land，called New England，on the south mountains of the Australian continent．It is quite hardy and of easy culture． 2982．Simèthis．Heath mould is the best soil for this plant，and it is increased by division．
2983．Echedindia is a tall plant．The flowers are greenish yellow，in clusters of 3－6，and issuing singly from small bracts．They open for 8 or 10 hours and then close and fade．The culture is easy．

2984．Chrysobáctron．This pretty little plant grows in boggy places．The pot in which it is grown should be placed in ater to about the middle．

18964 Umbels bulbif., Lvs broad lin. keeled with carinate sheath rough edg. and keel, Seg. of Per. rough, Stam. exsert. 18965 Leaves linear triquetrous, Scape terete, Umbels globose much longer than the spathe, Segments of Perianth acute equal in length to the stamens

18966 Leaves linear subglaucous smooth longer than the scape channelled, Umbels 2-3-flowered
[about 2-fiwd
18967 Stems terete glabrous sulcate, Branches divaricate ultimate ones forked, Lvs scale-formed, Pedun. stiff 2-edged
18568 Leaves rushy erect glabrous length of humble branched scape, Umbels terminal about 4-flowered, Bracts mucronate, Stigma papillose
[obtuse longer than stamens
18969 Leaves acuminate channelled length of corymbose raceme, Filaments lanceolate, Sepals and Petals oblong-
18970 Lvs glauc. very long chnld, Pan, divaric., Seg. of Per. lin. undul, coherg at length spreading, Cells of Ov. 2-sd.
18971 Lvs ascend. broadish channelled with white margins longer than corymbose scape, Sepals and Petals obl. obt.
18972 Leaves Iinear channelled glabrous longer than oorymb, Corymbs on short peduncles spreading, Pedicels refracted after florescence, Bracts oval, Ovarium 3-lobed
18973 Raceme loose many-flowered, Flowers twin, Leaves ensiform acute
18974. Very close to S. peruviana but much smaller in all its parts, Flowers of the same greyish hue and corymbose arrangement, Bracts curved inwards at top
\(\beta\) Sepals and Petals yellowish brown, Ovarium and Filaments blue
[linear almost sterile
18975 Close to S. itálica, Racemes loose 3-5-flowered, Bracts as long as pedicels at first but become shorter, Filaments
18976 Lvs numerous ensif. longer than scape, Racs elong., Bracts small scarious, Seg. of Per. lin. longer than stamens 18977 Lvs strap-shaped flat recurved, Scape terete few-Hwd, Peds longer than bracts, Seg. of Perianth ovate at length 18978 Bulb l-leaved very like a small Lily of the valley, Racemes 3-5-flowered, Anthers yellow
[reflexed
18979 Leaves linear narrow glancous, Stem simp.e 2-3-forked, Peduncles bracteate
18980 Leaves linear elongated keeled, Sheathing glaucous beneath, Flowers racemose, Pedicels 3 together, Stamens thickened

18981 Leaves flat, Racemes loose panicled

18982 Leaves sheathing erect glaucous linear-lanceolate acute, Stem terete branched with a long lanceolate sheathing pale green bract, Flowers issuing singly from small bracts

18983 Leaves linear ligulate acuminated, Racemes loose-flowered, Ovarium obovate, Capsule on a short stipe
18984 Branches very long climbing with straight prickles, Leaves linear-falcate lucid, Peduncles 1-flowered
18985 Leaves succulent, Scape racemose destitute of a coma
18986 Leaves glaucous a foot long channelled rather scabrous on the margins, Peduncles spleading racemose
18987 Corolla campanulate, Flowers racemose, Pedicels longer than the flowers, Filaments membranous, Anthers blue, Capsule roundish at top
[or in pairs
18988 Trailing, Spines tripartite, Leaves linear pungent bright green fascicled, Peduncles axillary 1-flowered solitary 18989 Spines large palmate, Leaves small dark green spiny in fascicles, Peduncles 1 -flowered clustered
18990 Straggling, Leaves small ovate or oblong dark green above rather glaucous beneath toothless spiny-pointed, Spines large tripart., Fiws single or in clusters [old plants, Spines small slightly tripart., Flws in clusters
18991 Branches downy, Leaves small oblong having 3 or more spiny teeth while young, narrow and mucronate in the 18992 Leaves in clusters 3-4 inches long serrulated ending in a straight point on each side with a spiny point bright green above pale beneath. Spines tripart. slender, Flws in fasc.
[on each side near middle, Racs erect
18993 Brans ferrug., Lvs small close together deep green with three large spiny teeth at apex and one or two more 18994 Lvs narrow obov. 3-5-lobed spinose glauces. above green beneath, Racemes few-flowered, Flowers small
8995 Lvs obov. obt. bright green with a spiny point and several teeth on each sid., Spines small palm., Racs pan. erect 18996 Rigid, Spines 3 -5-parted, Lvs fascicled coriac. wavy opaque mucr. sometimes obl.-lanc., Rac. erect nearly sessile 18997 Brn. bearing lvs of two forms, low. cord. ang., up. obov.-ellip. cori. wavy with a few marg. spiny th, Racs droop.

> and Miscellaneous Particulars.
2985. Drimmiópsis. A greenhouse bulb requiring the same treatment as Drimmia and Lackenàlia.
2986. Bellevalia. Hardy bulbs of easy culture.
829. Bérberis The fruit of B. buxfolia were used by the officers of Sir James Ross's expedition for tarts and found excellent. B. tinctoriau furnishes a yellow dye. B. Lycium has been discovered by Dr. Royle to be the real Lycium indicum of the Greek physicians, and to this day its extract is used against Ophthalmia with as great success as in the days of Dioscorides. It is an erect subevergreen. In winter the ieaves are nearly green on both sides, and at length become dull purple. The berries of \(\mathcal{B}\). trifoliata are eaten by children in Mexico.

19004 Lvs pinnate, Leaflets broad trifurcate, Racemes compound erect
[longer than lvs, Petals small
19005 Lvs pinnate, Leaflets \(7-15\) nearly sessile ovate obtuse mucronate entire, Racemes compound loose drooping 19006 Lvs pinnate slightly prickly, Rac. panicled, Berries round dark purple particularly acid

19007 Lvs pinnate a foot long with \(5-6\) pair of sessile ovate-oblong spiny-toothed leaflets the largest 3 inches long and 1 broad, Racemes simple erect, Berries oblong dark purple 19008 Lvs 18 inches long with 11-12 pairs of closely set leaflets
[long and deeply cordate with 5 coarse spiny teeth on each side 19009 Lvs 15 inches long, Lfits 5 slightly cordate, sessile with \(3-4\) spiny teeth on each side, the terminal one 5 inches [lous many-fiowered, Berries red oblong
19010 Spines strong tripartite, Livs lanceolate or obovate entire or awnedly serrated green on both sides, Rac. pendu19011 Glabrous dark green, Lvs of \(7-9\) linear lanceolate spiny serrated very acute leaflets, Rac. panicled the lateral branches spreading dense-flowered
19012 A dwarf shrub with fusiform roots, approximate trifoliate leaves, and large yellow flowers disposed in terminal racemes
19013 Lvs narrow grass-like, Spike bifid
19014 Glabrous, Lvs alternate plicate ovate-oblong tapering to both ends nearly sessile coriaceous callously toothed, Rac. simple terminal, Flwrs sometimes 7 -cleft white tinged with purple
19015 L.vs oblong narrowed at base upper ones petiolate longer than the lax pedunculate flowers
[late large inflated 6-angled coloured 19016 Herbaceous tufted, Radical Ivs linear-spatulate rather fleshy l-nerved, cauline lvs subconnate, Calyx campanu-

19017 Perianth yellow with a brown transverse mark and spotted at base downy

Lamina obovate, spreading. Stamens 9, combined with the lamina, torus, and stipe of ovarium: Filaments filiform, exserted, ascending. Ovarium stipitate, 3-celled. Ovula twin in the cells. Styles very short. Stigma simple.

\section*{MONOGYNIA.}

19918 Leaves alternate imparipinnate, Leaflets 3 pair, Racemes lateral corymbose
[fascicled, Flowers hexandrous 19919 Arboreous, Leaves pinnate 3-5 pair of lanceolate smooth undulated acuminated leallets, Corymbs terminal

and Miscellaneous Particulars.
2991. Triméxia. This genus is nearly allied to Eleutherine, and requires the same kind of treatment.
2992. Ungnãdia specidsa is a fine hardy tree, lately introduced, nearly allied to the \(\mathbb{K}^{\prime}\) sculus. It may prove to be a handsome tree. It requires the common treatment of the horsechestnuts, and may be propagated by grafting on a common horsechestnut.
19019. Jonèsia Asoca. The flowers of this tree are orange, scarlet, pale yellow, and bright orange. The Brahmins, who adore beautiful objects, have consecrated the lovely Asoca, which they plant near their temples, and frequently mention a grove of it in which Ravan confined the unfortunate Sita. The eighth day from the new moon of Chaitra is called Asocastanii.

History, Use, Propagation, Culture,
2993. Acronýcha Cunninghamiz is at tall handsome evergreen shrub, a native of Moreton Bay. The flowers at first sight have a good deal the appearance of those of the orange, as well as in the odour ; but it is combined with the aromatic warmth of ginger. The foliage emits a turpentine smell when bruised from the numerous pellucid glands
2999. 910a. Edgworthia. Perianth 4-parted. Hypogynous scale 1 emarginate. Stamens inserted in 2 series. Ovule solitary. Stigma elongated, subulate. Nut fibrous
3000. 916c. Buginville' \(\alpha\). Involucrum 3-leaved, with a flower springing from near the base of the midrib of each leaf. Perianth tubular, 5-toothed. Stamens enclosed. Stigma undivided. Achenia angular, hard. Fruit I-celled.

Order 2. DIGYNIA. 8 Stamens. 2 Styles.
3001. 919a. Geissois. Calyx 4-parted, deciduous. Petals wanting. Style 1. Stigmas 2. Capsule compressed, 2-celled, 2-valved. Cells many-seeded. Seeds compressed, winged.

Order 3. TRIGYNIA, 8 Stamens. 3 Styles.
3002. 92la. Sarcogдnum. Flowers polygamous, Styles 3, or Style 3-parted. Stamens 8. Perianth baccate Berry white, juicy. Nuts angular.
3003. 921b. Fagopyrum. Perianth 5-cleft, equal, shorter than the achenia when mature Hypogynous glands 8 , hemispherical, alternating with the stamens. Anthers versatile. Styles 3, long. Stigmas capitate. Achenia large, triquetrous. Seed free.

Order 4. TETRAGYNIA. 8 Stamens, 4 Styles.
3004. 932a. Louddnia. Calyx 4-toothed, superior: Tube tetrapterous, verrucose. Petals, cucullate, imbricate in æstivation. Stamens 8. Anthers linear. Disk none. Ovarium 1-celled, biovulate. Ovules pendulous. Styles 4. Stigmas roundish, discoloured.

\section*{MONOGYNIA.}

19020 Root tuberous, Lvs of 5-6 glaucous linear-lanceolate leaflets, Petioles long twisted, Peduncles I-fwd, Upper 2 Petals obcordate, lower 3 smaller spatulate emarginate, Spur large
19021 Lvs peltate 5-lobed, Segments acute, Stipules jagged, Peduncles long twisted, Petals cuneate, 2 upper smaller sessile, 3 lower unguiculate, all jagged and ciliated, Spur subulate straight
19022 Lvs peltate 5-7-lbd, Lbs rndish quite ent. ,Pet. denticulately ciliated length of cal., Sep. appendiculate at base 19023 Pil., Lvs orb. obsc. lbd pelt. glauc. ben., Lbs muc., Pet.obov. 2 up. ent. 3 low. smilr thd frngd at base on lng clws 19024 Lvs pelt. glab, ben. slght. 5 -lbd, mid. lobe muc., F1. axil. sol. pend., Pet. spat. serr., 3 low. on lng clws, 2 up. ses. 19025 Pil., Lvs subpelt., Lfts 6 obl. obov. obt. on short pet. Ped. long, Pet. obcord. 2-lobed, upper smaller, Spur long 19026 Root tuberous, Lvs deeply cut peltate roundish, Leaflets \(5-6\) obovate, Petals obcordate twice as long as calyx 19027 Leaves peltate suborbiculate 7-9-lobed, Lobes callous at tips, Petals nearly equal, 2 lower ones cuneate fringed at top, 3 upper ones spatulate fringed at base, Spur long
[subbicrenate, upper two lined with red
19028 Leaves peltate suborbiculate 5-lobed, Lobes obtuse or retuse mucronate, Petals obovate nearly equal truncate 19029 Rad. downy, Lvs pelt. triang. ovate sin., Peti. hairy, Pedunc. axil. twisted, Spur straight, Pet. wedge-shpd thd 19030 Glab., Lvs pelt. obl. triang. deep green, Ped. axil. at top of brnchs, Spur long orange tip. by green, Pet. cun. thd 19031 Root tuber., Lvs subpel. cord. 5-lbd, Flws umbei., Cal. cylind., Pet. spat. ac., 2 up. scale-frmd, Spur curv. obt. 19032 Root tuber, Stems ascending not climbing, Lvs numerous; 5-10-lbd, Lbs obl. or obov. glauc., Pet. obt. entire 19033 Root tuberous, Leaves peltate deeply 5 -parted, Lobes linear-lanceolate obtuse, Petals cuneated nearly equal spreading 2-lobed, Spur short conical
19034 Branches angular glabrous, Leaves pinnate, Leaflets 5 oblong-lanceolate obtuse, Peduncles umbellate hoary, Petals hoary, Anthers mucronate
19035 Leaves ternate with revolute edges hoary-tomentose from stellate hairs beneath
\(\beta\) Leafiets oval
19036 Leaves ternate, Leaflets linear revolute downy beneath, Peduncles axillary 1 -flowered
19037 Lvs pinnate 4-5 pairs, Leaflets linear obtuse smooth, Branches pilose, Ped. short 1-flowered, Flws tetrandrous
19038 Lvs obovate mucronate crenulated, Pedicels axillary and terminal 1-flowered, Filaments blunt glandular at tips 19039 Brncbs dichot. slend. flex., Lvs. lin. obt. flat nar. at base, longer than internds, Fls axil. on short peds, Fil. vill.
19040 Leaves linear retuse denticulated mucronate, Peduncles corymbose, Filaments blunt and glandular at tips
19041 Brachs comp, rough when young, Lvs short rndsh obo., but nar. and spat. on later brnchs, Fls small term. cym. 19042 Glabrous, Livs simple terete obtuse dilated at base sulcate, Cymes many-flowered on long peduncles, Filaments hispid
[at base
19043 Leaves oblong smooth acute at both ends, Cymes axillary, Filaments fringed all nearly combined into a tube

and Miscellaneous I'articulars.
with which they abound. The genus is nearly allied to Cyminosma, It grows freely in any common soil, and is readily increased by cuttings in the ordinary way.

History，Use，Propagation，Culture，
879．Tetratheca is a genus of delicate greenhouse shrubs，gay with pretty blossoms．They will grow freely in a compost of peat，loam，and sand in equal proportions，and if a few potsherds are mixed with it so much the better． In summer plenty of air should be given，and shade in sunny weather．In winter they should be placed in some airy part of the greenhouse where they will be secure from damp．Fire heat should not be applied except to keep off frost． They are propagated by cuttings in the usual way．
19052．Amyris toxifera is a large tree with pinnate leaves．The fruit hangs in bunches；they are pear－shaped， and of a purple colour．The juice distilled from the trunk of the tree is as black as ink，and the inhabitants of Carolina believe it to be poisonous．It is called Janca tree and White Candlewood；and the wood is said to be valuable as timber；it bears a fine polish and has a pleasant smell．The fruit has much the taste of balsam of Copaiba．

19044 Branches tomentose sometimes setose, Leaves oblong scattered or opposite tomentose beneath hispid above, Peduncles setose or scabrous, Flowers pentamerous
19045 Branches slender downy, Leaves linear in whorls acute hairy, Peduncles axillary hairy, Petals cordate-ovate
[axillary corymbose, Anthers scabrous beaked, Flowers pentamerous
19046 Branches hispid from red bristles, Leaves cblong linear revolute scabrous above tomentose beneath, Pedtucles 19047 Glab. or a little pil. at base, Lvs ov. -obl. or roundish verticil. or scat. shorter than internodes, Flws pentamerous 19048 Glabrous, Branches rush-like, Leaves linear deciduous many deficient, Peduncles scattered length of corolla, Petals obovate, Flowers pentamerous
[Cal. truncate
19049 Clothed with stellate down, Lvs cordate-ovate obtuse undulated at length glabrous, Flws solitary pendulous, 19050 Leaves spreading elliptic or oblong glabrous above clothed with rusty tomentum beneath as are the branches, Flowers 1-3 terminal cylindrical, Stamens much exserted
19051 Leaves glabrous obovate spatulate obtuse coriaceous entire with revolute edges glaucous beneath, Peduncles axillary by threes or fours, Calyx 8 -parted, Corolla biseriate, outer series 10 -inner 8 -parted all entire

19052 Leaves pinnate, Leaflets 5-7 stalked ovate subcordate acuminate, Racemes simple about the length of the petioles

19053 Glabrous, Leaves imbricate in 4 ranks obovate acute dotted immarginate on short petioles, Stamens 10, Flowers solitary or twin in the axils of the upper leaves on short pedicels
19054 Leaves in fascicles fleshy glabrous channelled above, Flowers diœecious glomerate, female ones solitary much shorter than leaves, Fruit 3-winged
[Flowers erect, Petals obovate, Stamens 10 fertile 19055 Erect, Los cordate-ovate obtuse tubercled hoary beneath, Panicles terminal and axillary, Bracts ovate caducous, 19056 Erect hispid, Lvs ovate-lanceolate 3-nerved, Flwr terminal pedunculate, Segs of Calyx ovate-lanceolate ciliated,
\(\beta\) Flowers white
[Hairs of Tube branched, Petals obtuse ciliated, Stamens 8
19057 Subscandent, Branches pendent, Leaves subcordate-ovate acuminate crenulated ciliated tomentose beneath as well as branches and petioles, Panicle elongated nutant
[pedicellate disposed in a leafy raceme 19058 Suffruticose much branched, Lrs nearly sessile oblong obtuse mucronate downy 3-nerved, Flowers axillary 19059 Suffruticose branched, Leaves sessile ovate rather cordate entire 3-nerved downy as are the branches and calyxes, Flowers axillary pedicellate, Lobes of Calyx lanceolate subulate
19060 Leaves ovate-lanceolate unequal-sided, Racemes subcorymbose terminal
[bristles at edges downy on veins beneath, Cymes trichotomous, Petals obovate 19061 Stem and branches tetragonal covered with bristly hairs, Leaves triple-nerved petiolate ovate acute with stiff 19062 Branches straggling hoary, Leaves unequal-sided petiolate acuminate bristly at edges pale beneath and downy on the veins, Flowers few terminal, Petals obovate
19063 Branches tetragonal beset with glandular hairs, Lvs ovate-cordate acute 5 -nerved serrated, Cymes loose terminal few-flwd, Calyx glandular, Spurs of Anthers bifid
[or bracts cordate, Capsule cylind. sulcate hairy
19064 Erectish branched a little hairy, Lvs semi-amplexicaul toothed a little, lower ones ovate-acuminate, upper ones 19065 Branched downy, Lower Leaves elliptic entire or few-toothed, upper ones sharply toothed and divided at base, uppermost ones pinnatifid, Tube of Flwr long, Petals large crenul. [yellowish, Fruit lin. 4-fur. terete downy 9066 Erect, Lws lanc. a little toothed green smoothish, Tube of Calyx obconical shorter than segs, Lobes of Stigma 19067 Branches short crowded, Leaves glaucous lanceolate entire glabrous, Flowers sessile, Petals obcordate, Fruit oblong 8 -furrowed terete villous

19068 Lvs lanc. stalked irregularly toothed, Stem obsoletely angular, Stigma slightly lobed, Barren shoots none
[part, Flowers axillary solitary drooping, Petals obcordate
19069 Glaucous, Lvs linear sessile slightly toothed opposite on the lower part of the stem and alternate in the upper \(\beta\) Leaves linear-lanceolate
y Leaves ovate-lanceolate

and Miscellaneous Particulars.
2994. Oxýspora. The species of this genus are small shrubs of considerable beauty when in blossom. A compost of loam, peat, and sand will suit them, and they may be propagated by cuttings in the usual way. They require a moist atmosphere.
2995. Marcètia is nearly allied to Oxyspora, and may be treated in the same manner with regard to both cultivation and propagation.
2996. Centradenıa. Pretty soft-wooded plants, which thrive best in sandy peat with a little loam, and cutfings strike freely.
2997. Zauschnèria. These are pretty glaucous plants with bright scarlet flowers. They may be grown in pots as ornamental plants for the greenhouse or conservatory. They also answer well for fower-beds or borders: the root creeps like French willow in a light dry soil.

History，Use，Propagation，Culture，
2998．Lagétta lintearia is the famous Jamaica lace－bark tree．Many persons have seen this beautiful substance but few have seen the living tree，for it was not until 1844 that it was introduced permanently to our hothouses，and then only through Mr．Wilson，curator of the Botanic Garden at Bath in Jamaica，to Kew Gardens，where it flowered and fruited in the autumn of 1849．It is well known that the liber or inner bark of this tree consists of layers of reti－ culated fibre，exactly resembling well prepared lace，and its nature is best exhibited by taking a truncheon from a branch and tearing down the bark and separating it by hand into as many layers as that portion of the tree is years old．The ladies of Jamaica，Lunan observes，＂are extremely dexterous in making caps，ruffles，and complete suits of lace with it．＂In order to bleach it after being drawn out as much as it will bear，they expose it stretched to the sun－ shine and sprinkle it frequently with water．It bears washing well with common soap，and acquires a degree of white－ ness equal to the best artificial lace．The wild negroes have made apparel from it of a very durable nature，but the common use to which it is applied is rope－making．The Spaniards are said to have worked it into cables．It was also made into negro whips in the days of slavery．The tree grows in marly limestone hills where there is not a particle of earth to be seen．In this country，according to Mr．John Smith of Kew Gardens，it is best grown in good yeliow loam mixed with a little leaf mould and sand．It is difficult to propagate，and is most likely to succeed according to the same authority by layering．The tree is deciduous in its native country，but in our hothouses it becomes ever－ green．

19070 Stem prostr, radicant, Lvs opp, ternate a little toothed purplish beneath, Stip. fleshy, Ped. solitary axil. 1-flwd, Seg. of Cal. acum. twice the length of petals, Pet. obcord.
[lanc--acum. twice as long as cuneate pets 19071 Subscand. pubes., Lus opp. obl. or ov.-lanc. scarcely toothed, Stip. memb., Ped. axill. sol. 1-flwd, Seg. of Cal. 19072 Downy, Lvs opposite or ternate on long petioles ovate-cordate denticulated acuminate, Peduncles filiform axillary solitary \(1-f\) wd, Segm. of Calyx triangular longer than petals

and Miscellaneous Particulars.
2999. Edgứrthia is a half-hardy shrub, and grows freely in a compost of sandy loam and one of turfy peat with sufficient drainage, for although it requires an ample supply of water while growing during summer it is liable to damp off in winter, and for a few weeks at this time it requires little water. The flowers being sweet-scented and the plant of free growth, it may be expected to prove a useful addition to our greenhouses.
3000. Buginvilla'a is a fine stove climber, suited for training upon trellis-work or pillars. The purple bracts are the orincipal feature of the plant. A compost of sand, loam, and turfy peat answers it well, and cuttings strike root freely
is the ordinary way. is the ordinary way.
2001. Geissois. This plant being so recently introduced, very little is known of the manner in which it should be ultivated. The flowers are a bright crimson and grow in long dense racemes,
19096. Polggonum cuspidatum is said by De Vriese to be the handsomest of all the species. P. Brunonis and \(P\). vaccinizfolium are well fitted for ornamenting rockwork. \(P\). compléxum is a small round-leaved climbing species, Nell fitted for covering pillars in a conservatory or greenhouse, and is probably a species of Sarcogdnum. From \(P\), Thinénse, but more particularly P. tinctor rium, indigo is prepared in China. Which last is cultivated extensively in Belgium as a substitute for the true indigo, and is said to produce the dye in great abundance and of the finent auality.

History, Use, Propagation, Culture,
3002. Sarcogdnum. A climbing plant of the most easy culture. It will grow in any light soil, and is readily increased by cuttings or berries.
3003. Fagopyrum cymosum is a pretty plant of the most easy culture. It will grow in any common garden soil and may be increased by dividing the roots or by seeds.
3004 . Loudonia. This is a pretty shrub, with corymbs of golden yellow flowers. A comoost of sand, loam, anc peat will probably suit it well, and cuttings will strike root in the ordinary way.

19096 Lvs broad-ov. hardly cord., Stem rnd hollow spotted with purple, Stipules obliq. trun. purple, Pan. axill, divar. 19097 Half-shrubby forming a bush, Lvs lanceolate pale green acuminated hairy, Panicles dense terminal
19098 Erect, Lvs radical on long petioles cordate-ovate acuminate crennlate and entire, upper leaves stem-clasping, Spikes elongated many-fowered, Bracts ovate-acuminate imbricate, Stamens exserted
19099 Lvs ovate-lanceolate stalked bearded along the midrib, Heads of Flowers small, Flowers small fleshy succeeded by black succulent berries
19100 Stems numerous, Stipules membr., Lvs ovate entire glabr, thick fleshy, Spikes long branched, Style semibifid

19101 Glabrous, Stems twining or prostrate terete, Lvs cord.acuminate crenulated with scabrous edges, Racemes axillary or terminal, Bracts and achenia naked

19102 Root stoloniferous, Lower Lvs triangular cordate or hastate with bluntish lobes, upper lvs oblong or lanceo-late-sagittate, Panicles on long peduncles nearly leafless dichotomous or trifid

19103 Glabr., Stem simple, Lvs cordate-ovate acute sessile stem-clasping bullate veined, Ochrea large inflated, Racemes dense spicate elongate simple terminal, Flws copious, Perianth 4-6-lobed, Stamens 8-12
19104 Lvs ovate-lanceolate obtuse tapering into the petioles, Racemes nutant, Flowers decandrous

\section*{TETRAGYNIA.}
[Panicles terminal corymbose, Upper bracts petaloid obovate 19105 Glab., Stem erect terete simple leafy at base sometimes leafless at top, Lvs alternate coriaceous quite entire,

4 series, the 9 outer ones fertile, 3 inner ones sterile; these last are furnished with twin sessile subglobose glands at both sides. Anthers ovate, membranous at tips. Style thick. Stigma capitate. Ovarium 1-celled, 1-seeded
3006. 934a. Oreodáphne. Hermaphrodite diœecious or polygamous. Perianth 6-parted. Stamens 9. Anthers oblong narrowed into the filaments, 4 -celled; cells placed by pairs one above another: three of the inner anthers reversed. Berry more or less immersed in the tube of the perianth, which becomes a thick cup.

\section*{MONOGYNIA.}

19106 Lvs alternate crowded, Buds stipitate 2-valved, Panìcles terminal contracted

19107 A large tree growing about Santa Cruz

19108 Los elliptic or oblong-elliptic reticulated blistered above, Racemes few-flowered axillary and terminal rising from beneath the buds

and Miscellaneous Particulars.
3005. Agathophyllum. This is a tree not much known. It will require to be grown like other stove plants. It will propagate by cuttings. It is called Madagascar Nutmeg.
3006. Oreodáphne. This tree will only require the treatment usually given to greenhouse plants. Oreodáphne bullàts is called stink hout or stink-wood; and the greatest part of the timber used in huilding, and indeed for every other purpose, in South Africa, consists of the giel hout (yellow wood, a species of Podocárpus) and the stink houl. Our plant is said to produce a handsome wood resembling mahogany both in colour and quality.

\title{
Page 338. Class X.-DECANDRLA. 10 Stamens.
}

\author{
Order 1. MONOGYNIA. 10 Stamens, 1 Style.
}
3007. 948a. Animoréndron. Calyx 5-cleft, subbilabiate, at length reflexed. Wings and dipetalous keel equal and connate. Legume flat, membranous, 1 -seeded by abortion, samaroid, marginate by a wing. Seed reniform, compressed.
3008. 949a. Dichosèma. Calyx campanulate, bilabiate: upper lip bifid, lower lip tripartite. Corolla with a broad bilobed standard, much exceeding the small wings : keel straight, obtuse, a little shorter than wings. Stamens uniform. Ovarium sessile, many-ovulate, somewhat 2 -celled from the suture being inflexed. Style uncinate, bearded on the under side. Stigma capitate.
3009. 953a. Jansonia. Calyx bilabiate: upper lip bifid nearly to the base; lower lip much longer, tripartite. Corolla with an ovate-lanceolate reflexed standard, which is shorter than the elliptic wings: keel compressed, longer than wings. Stamens unequal. Ovarium villous, substipitate, \(4-5=0\) ovulate; the stipe surrounded by a little sheath. Style elongated, incurved at top. Stigma small.
3010. \(978 a\). Coulteria. Calyx turbinate, 5 -cleft; the lower lobe the largest, and pectinately toothed with glands. Petals 5, upper one the largest. Stamens bearded at base, and with a nectariferous gland on the upper side of the ovarinm. Style short. Stigma glandularly ciliated. Legume flat, spongy, hardly dehiscent, but usually divided transversely into cells, 4-6-seeded.
3011. 987 a. Cupania. Calyx 5-cleft, or 5 -parted. Petals 5, each furnished with a small scale above the base inside. Disk regular, occupying the bottom of the calyx, entire or crenulate. Stamens sometimes \(9-5\), inserted between the edge of the disk and ovarium. Style bifid or undivided. Capsule pear-shaped, 2-3-seeded, 2-3-valved, \(2-3\)-celled. Seeds erect, arillate.
3012. 989a. Turre'a. Calyx 5-cleft. Petals 5, long, strap-shaped. Stamens combined into a very long tube, which is 10 -cleft at apex, with an anther seated at the base of each lobe or between them. Stigma thickish. Capsule 5-celled. Cells 2-seeded: Valves with a dissepiment in the middle of each.
3013. 989b. Munrònia. Calyx 5-cleft: Segments linear. Petals 5, bound together by the claws. Stamens combined into a tube, ending in 10 subulate segments, and bearing an equal number of anthers inside. Ovarium downy, 6 -celled. Cells 1-2-seeded. Stigma obscurely 5-lobed.
3014. 999c. Acradenia. Calyx 5-parted. Petals 5, velvety. Stamens glabrous, about equal to corolla. Anthers glabrous, inappendiculate. Carpels 5, cohering, seated on a fleshy lobed gynobase, villous, each bearing a smooth sessile fleshy gland at its upper angle. Ovula 2 in each cell, collateral, pendulous. Style long, length of stamens. Stigma slightly capitate.
3015. 999d. Diplole'na. Involucrum double, outer one 5-parted, inner one \(10-15\)-parted, many-flowered. Flowers sessile, furnished with a 5 -leaved chaffy calyx and a 5 -petalled corolla. Stamens exserted: Filaments fringed. Style 5 -furrowed. Stigma 5-lobed. Fruit of 5 distinct, 2 valved, 1 -seeded carpels. Seeds oblong.
3016. 999e. Biebersteinia. Calyx 5-parted, irregular. Petals 5, twisted in the bud. Stamens subulate; the 5 shortest opposite the petals, the alternate 5 furnished each with a scale on the outside at the base. Anthers axiliary Ovaria 5, distinct at the apex, but connected at base. Styles 5. Carpels l-seeded, arillate inside.
3017. 1012a. Ammyrsìne. Calyx deeply 5-parted. Petals 5. Stamens exserted. Anthers opening by two terminal pores. Capsule 5 -celled, 5 -valved, dehiscing at apex.
3018. 1014a. Bryänthus. Calyx 5-leaved. Corolla 5-parted. Filaments flattened, glabrous. Cells of Anthers short, mutic, or awned behind, each dehiscing by a terminal pore. Stigma obtuse. Capsule 5 -celled, with a septicidal dehiscence.
3019. 1016b. Thibatidia. Calyx urceolate, 5-lobed. Corolla tubular, coarctate at apex, 5-lobed. Stamens inclosed : Filaments short, dilated. Anthers 2-celled, shortly spurred at base, and drawn out into 2 tubes at apex: cells or tubes parallel, dehiscing lengthwise by a linear fissure. Style pentagonal. Stigma large, peltate. Berry 5 -celled. Cells many-seeded. Seeds minute, angular, dotted.
3020. 1016c Leucothoe. Calyx 5-leaved. Corolla tubular, 5-toothed. Stamens inclosed. Filaments flattened, downy. Cells of Anthers short, truncate, mutic. Stigma capitate. Capsule with a loculicidal dehiscence.
3021. 1016d. Lyonia. Calyx 5-parted. Corolla ovate or tubular, with a 5 -tnothed contracted mouth. Stamens inclosed. Filaments dilated, short, downy. Celis of Anthers membranous, dehiscing lengthwise, mutic. Style strong, pentagonal, fusiform. Stigma simple truncate. Capsule pentagonal, 5 -celled, with a loculicidal dehiscence. Margins of valves closed by other external valves. Seeds acicular, imbricate.
3022. 1016e. Agarista. Calyx fleshy, 5-lobed. Corolla ovate, with a contracted 5-toothed mouth. Stamens ine closed: Filaments dilated, and villous at base. Anthers bipartite, with short membranous cells, which are mutic at base, and diverging at apex, each opening by a terminal pore. Style strong. Stigma capitate. Capsule globose, pentagonal, 5-celled, with a loculicidal dehiscence. Placentas thick, oblong. Seeds angular, curved.
3023. 1016f. Gaylussàcia. Calyx 5-cleft. Corolla tubular, ventricose, 5-lobed. Stamens inserted in the limb of the corolla, inclosed. Anthers mutic, drawn out at top into two little tubes. Stigma capitate. Drupe nearly globose, \(10-c e l l e d\), covered by the calyx. Cells 1 -seeded. Seeds smooth, lenticular.
3024. 1016 g . Macleania. Calyx truncate, obsoletely 5-toothed, 5-winged. Corolla cylindrical: Limb 5-cleft. Stamens combined, their whole length into an urceolus. Anthers mutic behind, and tapering into a single tube at apex, which opens inwardly by a single chink. Ovarium 5 -celled, many-ovulate. Fruit a berry.
3025. 1019b. Arctostäphylos. Calyx 5-parted. Corolla globularly campanulate: Limb 5-cleft, reflexed. Stamens inclosed: Filaments dilated, pilose. Anthers compressed, dehiscing by two pores at apex, and furnished with 2

\section*{History, Use, Propagation, Culture,}
19111. Sophora velutina. The flowers of this species are pale purple or red, disposed in long racemose spikes; and being very showy it would perhaps become more hardy by grafting it on Sophòrajapónica, which would make it a
refiexed awns. Ovarium seated on a hypogynous disk, or half-immersed in it, usually 5-celled, rarely 6-9-celled. Cells l-seeded. Stigma obtuse. Drupe nearly globose.
3026. 1019c. Comarostáphylos. Calyx 5-parted. Corolla globularly campanulate: Limb 5-cleft, reflexed. Anthers 2-awned at base, and biporose at apex. Ovarium surrounded by a hypogynous disk. Stigma obtuse. Drupe papillose, globose, containing a 5 -celled or 6-9 celled putamen. Cells 1 -seeded.
3027. 1029a. Chariúnthus. Calyx with an ovate tube, and a rather urceolate 4-5-lobed limb. Petals 4-5. Stamens 8-10. Anthers 2 -celled, bursting by 2 longitudinal chinks. Berry fleshy, 4-5-celled, globose, umbilicate.
3028. 1029b. Meridnia. Calyx campanulate, 5-6-lobed : Lobes broad at base and subulate at apex. Petals 5-6. Stamens \(10-12\). Anthers blunt at apex, bursting by 2 pores, and furnished with 2 short processes at base. Capsule free, \(5-6\)-celled, with lunate placentas. Seeds small, cuneate, angular.
3029. 1029c. Medinilla. Calyx with an obovate tube, and a cylindrical truncate limb. Petals 4-5. Stamens 810. Anthers elongated, bluntly biauriculate at base. Capsule baccate, 4-5-celled.
3030. 1029d. Heterótrichum. Calyx ovate, globose, 4-5-cleft: Lobes broad at base and subulate at apex. Petals 5-8, oval. Stamens 10-12-16, equal, glabrous. Anthers oblong, hardly gibbous at base, and opening by a single pore at apex. Capsule baccate, 5-6 celled, crowned by the calyx.
3031. 1029e. Lasińndra. Calyx 5-cleft. Petals 5, spreading. Stamens nearly equal, the connectives of anthers biauriculate. Anthers uniporose. Filaments usually pilose. Ovarium crowned by bristles. Capsule covered by the calyx, but free from it, 5 -celled, many-seeded.
3032. 1029f. Pleròma. Calyx ovate, often involved by two deciduous bracts. Petals 5, obovate. Stamens glabrous. Anthers nearly equal, elongated, arched at base, each furnished with a stipe-formed connective, which is biauriculate at base. Ovarium bristly. Capsule baccate, 5 -celled, adnate to the calyx. Seeds cochleate.
3033. 1029g. Bertolonia. Calyx campanulate, 5-lobed. Petals 5, obovate. Stamens rather unequal. Anthers ovate, obtuse, opening by a single pore, scarcely auriculate at the base. Capsule trigonal, 3-valved, cut transversely, and therefore exhibiting the appearance of a lid. Seeds cuneate, triquetrous, scabrous.
3034. 1029h. Tetrazggia. Calyx with a globose tube and a 4-toothed limb. Petals 4, obovate. Stamens 4-810, equal. Anthers linear, obtuse at hase, opening by a single pore at apex. Capsule baccate, 4 -celled. Seeds cuneate, angular, with a linear hilum.
3035. 1029i. Olinia. Calyx bibracteate, adhering to the ovarium at base. 5 - rarely 4-toothed. Petals 5 rarely 4, spatulate, obtuse. Stamens 5-10, inserted in the throat of the calyx under scales. Anthers globose, didymous, dehiscing lengthwise. Ovarium truncate, 4-5-celled: Cells 3-ovulate. Style subulate. Stigma elongated, thickened. Berry drupaceous, containing a \(3-4\)-celled putamen : Cells 1 -seeded.
3036. 1029k. Eriocnèma. Calyx 5-parted, with campanulate tube and narrow simple or duplicate segments. Petals 5, oblong-obovate, glabrous. Stamens equal, or nearly so, uniform. Anthers linear, subulate, opening by a single pore at apex, the connective not drawn out. Ovarium free or adhering to calyx at base, roundish or ovate, crowned by bristles. Stigma small. Valves of Capsule septiferous in the middle. Flowers uinbellate.
3037. 1034b. Verticórdia. Flowers girded by two free or concrete bracts before expansion. Calyx 5-lobed : Lobes palmately parted into 4-9 divisions. Stamens 20 , of which ten are sterile and ligulate, and the other 10 fertile and equal. Style filiform, exserted. Stigma bearded. Fruit 1-seeded, but the ovarium contains \(5-6\) ovules. Seed globose.

Order 2. DIGYNIA. 10 Stamens. 2 Styles.
3038. 1038a. Acrophýllum. Calyx 5-parted. Petals 5. Hypogynous disk small. Styles setaceous. Berry globose, 2 -celled. Cells many-seeded. Seeds minute, smooth.
3039. 1038b. Codia. Calyx 4-5 parted. Petals 4-5. Stamens 8-10. Ovarium 2-celled, adhering to the calyx. Styles downy. Capsule closed at apex, usually l-seeded by abortion. Seeds roundish, mooth, with a bony testa.
3040. 1038c. Rhodoleía. Calyx minute, truncate, adnate to the ovarium at base, increasing and persistent. Corolla none. Ovarium with many glands at base. Styles long. Stigma obtuse. Capsule 2-celled, many-seeded. Seeds compressed, obliquely subtriangular.
3041. 1043a. Hoteía. Calyx 5-parted. Petals 5, spatulate. Stigma obtuse. Ovarium 2-celled, many-ovulate. Carpels 2, adnate to the calyx. Seeds scrobiculate, \(1-2\) in each cell.
3042. 1044a. Tùnica. Calyx turbinate. Coroila salver-shaped or funnel-shaped. Petals unguiculate. Flowers solitary or in fascicles. Fascicles girded by a 4 -leaved scarious involucrum ; the central fascicle pedunculate; the lateral fascicles sessile, and girded by 2 scarious bracts at base.

\section*{Order 3. TRIGYNIA. 10 Stamens. 3 Styles.}
3043. 1050a. Viviània. Calyx campanulate, 5.toothed. Petals 5, unguiculate, twisted in æstivation. Stamens inserted on the top of the torus. Style short, crowned by 3 linear stigmas, with reflexed edges. Capsule 3 -celled, 3-valved: Valves separating from the axis, even to the placentas, as in Linum.
3044. 1055a. Heterópteris. All as in Banistèria, except the styles, which are less dilated at apex, and the wings of the carpels are thickened on the lower side, as in \(A^{\prime} c e r\), not on the upper side.

Order 4. PENTAGYNIA. 10 Stamens. 5 Styles.
3045. Quillaja. Calyx 5-cleft. Segments ovate, tomentose, with truncate margins. Disk combined with the calyx, 5-lobed, stellate, leshy, smooth, nectariferous. Lobes emarginate. Petals 5, spatulate. Stamens disposed in two series. Carpels 5, combined. Styles free. Stigmas unilateral.

\section*{MONOGYNIA.}
[at base shorter than wings, Petals of keel separate longer than wings 9119 Leaflets 20 pairs elliptic-obovate smooth above and rathe: villous beneath, Vexillum large roundish subcordate 9110 Leaves with 13-19 pairs of elliptic-oblong obtuse coriaceous leaflets silky beneath, Racemes short axillary

9111 Leaves with 23 alternate elliptic velvety leaflets, Racemes cylindrical terminal, Petals imbricate, Vexillum bifid
9112 Leaves stalked, Leaflets rhomb-ovate cuneate rather silky pubescent beneath, Stipules obliquely ovate, Lower flowers of raceme twin

\section*{and Miscellaneous Particulars.}
ery desirable addition to our hardy shrubs. There was, in Kensington Gardens, some years ago, a large Sophoro, robably the \(S\). chinénsis Hort., very nearly related to \(S\). japónica, and was possibly introduced at the same time.

History，Use，Propagation，Culture，
3007．Ammodéndron．A native of the salt steppes in Siberia；comes near to Halimodéndron，of which the habitat and culture are the same．Sand，loam，and peat would be a good soil for it，watering occasionally with salted water． 3008．Dichosema is a genus nearly related to the narrow－leaved Chosozimas．The species are very pretty，and require the same treatment as Chorozema．

3009．Jansònia formòsa．The nearest affinity of Jansonia is with Brachysèma，with which genus Mr．Kippist states that it agrees in its unguiculate petals，in the form and unusual length of the keel，in the extreme shortness of the standard，in its elongated filiform style，and in its shortly stalked villous gerins，surrounded at the base by a minute fleshy ring ；but it is abundantly distinguished by its capitate inflorescence，by the remarkable inequality of the calyciut

19113 Smooth, Leaflets setaceous acute, Segments of Calyx obtuse, Bracts roundish keeled
19114 Silky, Petioles hardening into spines, Leaves bifoliate, Leaflets lanceolate silky white, Flowers purple disposed in racemes
[1-flowered, Corollas large
19115 Branches irregular sijghtly drooping, Leaves few sessile spatulate retuse, Peduncles very long axillary solitary 19116 Leaves nearly sessile roundish cordate undulated spiny-tonthed and entire downy, Racemes erect many-flowered a little longer than leaves
\(\beta\) Flowers larger, orange and scarlet instead of yellow and red
19117 Leaves sessile ovate-lanc, mucronulate, Flowers axillary solitary or in pairs on long peduncles, Vexillum large 19118 Lvs scattered elliptic-lanc. obov. or cune. entire mucro., Rac. many-fwd axil. and term., Upper lip of Cal. bifid obtuse, Stigma truncate
[conspicuous veins, Racemes few-liwd, Pedic. bibracteate above middle
19119 Branches downy, Lvs broadly cordate with a stiff mucrone glab. undul. with entire thickened marg. and rather 19120 Leaves a little crenate oblong-lanceolate mealy above beset with adpressed hairs beneath, Flowers terminal disposed in verticillate heads
19121 Leaves lanceolate-linear entire with revolute edges, Racemes axillary and terminal many-flowered, Calyx attenuated a long way at base, Teeth hardly shorter than tube

19122 Branches hairy, Stipules roundish, Leaves linear bluntish with a thickened midrib and revolute edges, Flowers axillary pedunculate, Ovarium 6-seeded, Corolla red with a zone of crimson at base of standard
19123 This is probably only a variety of \(P\). trilobatum. It has much darker smaller and more prickly leaves, Flowers axillary orange-yellow, Keel dull red
[capitate, Pedun. bracteate, Bracts decid.
19124 Lvs 3-4 in a whorl or alternate bluntish with revolute edges, smooth except the middle nerve, Flus pedicellate 19125 Leaves opposite roundish-oblong coriaceous pilose beneath inucronate subcrenulate, Racemes umbellate terminal, Bracts subulate at base of pedicel, Segments of calyx reflexed, Legume villous pedicellate
19126 Leaves oblong retuse coriaceous reticulated glabrous, Corymbs axillary stalked crowded shorter than the leaves
19127 Leaves obovate cuneated mucronulate coriaceous, Racemes axillary short dense many-flowered, Calyx silky villous ferruginous, Ovarium 4-ovulate
19128 Lower leaves obovate, upper ones oblong or linear with a recurved mucrone, Racemes dense capitate few. flwd shorter than the leaves, Pods twice as long as calyx
[silky, Ovarium 4-ovulate 19329 Leaves obj.-linear or cuneate retuse or emarg. mutic, Racemes axillary and terminal elongate loose, Cal. rather 19130 Lvs obl. linear obtuse smooth above clothed with silky tomentum beneath revolute, Corymb loose verticillately racemose, Pedicel bracteate, Calyx silky downy, Wings of Corolla reflexed. [lanc. covered with brown hairs
19131 Downy, Stipules small, Leaves lanc. mucronate 6 inches long smooth above, Spikes term., Calyx seg, ovate19132 Leaves linear elongated mucronate reticulated with revolute edges, Racemes loose terminal

\section*{19133 Leaves obovate retuse, Flowers racemose}

19134 Leaves opp. rarely alternate ovate or ovate-lanc. muc. entire silky white beneath, Stips minute subulate, Racs. sub-compound, axillary shorter than leaves, Calyx silky, Wings and vexillum one-balf shorter than the keel

19135 Erect or ascend., Lvs opp. obl.-ov. emarg. mucr. retic. with subundulated minutely dentic. margs, Stips lanc. subul., Flws sessile crwdd into 4 -flwd drpng heads propped by 4 decus. ov.-coriac. brown bracts silky outside
19136 Branches angular, Leaves trifoliate, Leaflets broad linear acute, Keel bearded on the edges, Vexillum ample
19137 Leavis trifuliate, Leaflets linear glabrous with revolute edges, Racemes few-fowered, Calyx segments oblonglinear cuspidate
[axillary at tops of branches, Keel bearded 19138 Branches and leaves villous, Lvs pinnate, Lfts linear subulate with revolute edges, Peds solitary terminal and 19139 Hairy upright, Lvs pin. glauc., Lfts \(6-8\) pairs lin. obt. with rev. edges, Flws corymb., Keel brdd, Leg. smooth 19140 Stem warted, Leaves tritoliate, Leaflets linear wedge-shaped mucronate, Calyx downy inside, Keel smooth 19141 Glabrous, Stems filiform smooth, Leaflets 3 linear-muc. with revolute edges, Flowers solit. pedunculate, Vexil. emarginate twice the length of beardless keel [smooth above, Calyx hairy, Keel ciliated 19142 Pilose, Flowers capitate, Leaves impari-pinnate 3-4 pairs sometimes subpalmate, Leadets linear subulate muc.

and Miscellaneous Particulars.
segments, by the much greater length of the c'aws of the petals, and by the paucity of its ovales, which do not appear to exceed six in number. Mr. Kippist also compares it with Leptosema Benth., which is clearly distinguished by its bibracteate calyx, composed of two nearly equal lips, the uppermost of which is slightly bifid, its scarcely unguiculate vexillum; its wings about equal in length to the keel; the distinct inflexion of the carinal suture, as well as by its inflorescence: that of Leptoscma being a densely crowded raceme, while in Jansonia the flowers are perfectly sessile, and arranged in a verticilate manner round a common axis, which is slightly prolonged beyond the point from whence the flowers spring in the form of a short mucrowe. The culture recommended for Brachysema (p.342.) will answer for Jansònia also.

19153

19143 Lvs sess. or on short petioles linear-subul, stiff mucron. with revol. edges, Flws in the axils of upperlvs, Calyxes 19144 Ivs oblong-linear muc. retic, tapering a long way at base flat, Racs loose term. [long-awned, Keel ciliated 19145 Leafts 3 linear-lanceol. veiny mucronate with revolute edges, Stipules longer than petioles, Peduncles subterminal solitary bibracteolate, Corolla longer than calyx
[lose inside 19146 Branches puberulous, Leaflets glabrous linear mucronate, Peduncles axillary bibracteate, Margins of calyx pi19147 Villous, Leafiets linear-subulate bluntish mutic scabrous from dots, Peduncs axillary bibracteate, Flowers large
[teral loosely racemose, Legume stipitate ventricose 19148 Branches loosely divaricate alternately branched, Branches angular spinescent at top smoothish, Flowers la19149 Phyllodineous branches oblong cuneated at base sinuately toothed quite glabrous veiny, Flowers racemose, Calyx silky longer than Corolla, Legume stipitate
19150 Branches terete, Tube of Calyx much shorter than lips, Keel oblong longer than vexillum subulately mucronate at apex, Style strght at base incurv. at apex
[1-3 together pil. like calyx, Upper lip of cal. trunc, emarg. 19151 Brnchs slend, nearly glab., Lvs scat, or nearly op. lin. obt, or mucron, convex abve with revol. edges, Peds ax. 19152 Leaves narrow deep green pointed, Racemes dense-flowered, Flowers yellow with a few streaks of crimson
19153 Leaves ternately verticillate cordate-lanceolate mucronate with revolute wavy edges, Flowers verticillate
19154 Branches pilose stiff spreading, Lvs scattered or somewhat whorled stalked linear acute slightly scabrous little hairy, Veins prominent, Peds in twos or threes axil., Calyx pilose, Teeth of lower lip reflexed
19155 Lvs numerous sessile linear mucronate, Flws in clusters near ends of branches, Vexillum broad rather reniform 19156 Lvs linear twisted acute scabrous numerous, Branches scabrous, Corymbs terminal sessile
19157 Leaves terete obtuse hispid scab. from the tubercles after the hairs have fallen, Corymbs terminal pedunculate few- or dense-flowered, Calyx downy
19158 Leaves scattered or verticillate acicular pungent with revolute edges, Peds few-flwd axillary crowded, Branches canescent, Ovarium villous 19159 Loosely branched, Leaves opposite or tern coriaceous mucronate veiny, Flowers axillary tern, Bracts minute
[illary few-flowered, Calyx villous, Ovarium sessile villous 19160 Branches vilions, Leaves tern ovate acute mucronately pungent entire adult ones glabrous, Racemes short ax19161 Leaves nearly sessile opposite smooth heart-shaped, with equidistant spiny teeth, Flowers in clusters at end of shoots
[gins, Racs elongated terminal villous as are the calyx and ovary 19162 Velvety, Leaves tern nearly sessile cuneate-oblong or subbilobed mucronate with revolute subcrenulate mar19163 Branches glab., Leavs opposite or tern lanc. or oblong muc. entire glauc., Racemes axillary and terminal loose few-flwd, Calyx large, Upper lip broad bifid, Ovary stipitate villous
[minal scaly, Ovary stip. vil. 19164 Villous while young, Lvs opposite elliptic mucronate at length glab. above, Stips large triangular, Racs ter19165 Lvs 4 in a whrl, rthr silky ben. cun. subemrg. muc., Racs term. 1fess, Flws whrld, Two upper thh of cal. coher. 19166 Villous, Lvs opp. ov.-lanc. cord obt. mucr. undul., Bracts brown lanc., Ovarium stipit. vil., Racs term. axil. 19167 Tomentose while young, Leaves 3 in a whorl oval or roundish mucronate glabrous above, Racemes axillary capitate, Bracts dark brown, Ovaries nearly sessile villous
19168 Leaves cuneate-oblong retuse rather silky beneath reticulated with a deciduous mucrone, Heads few-flowered 19169 Lvs op. or scat. obov. cun. acute muc. entire, younger ones and branches silky, adult ones glabrous, Racs axillary dense few-flowered, Calyx silky, Upper lip bifid
[ther loose, Calyx downy 19170 Branches slender, Stips setaceous, Leaves tern lanceolate mucronate retic. glaucous, Racs axil. and term. ra-
[many-flwd, Floral stips imbric. connate by pairs into trifid bracts ciliated, Calyx bilab. ciliated 19171 Brnchs downy, Stips persistent erect, Lvs scattered subterete with invol. edges mut. glab.. Heads term. dense 19172 Pedics axil. twin elongated, Stips set., Leaves lin. laneeol. flat clothed with adpressed hairs as are branches, Heads at first terminal and then lateral, Bracts 2 longer than calyx [ers crowded in heads 19173 Branches tomentose, Lvs scattered linear involute minutely tubercled ben. hairy mucr., Stips subulate, Flow19174 Brnchs beset with loose silky hairs, Stip. persist., Lvs on short petioles obl.-lin. with rev, pilose edges, Heads term. leafy, Floral stips con. by pairs forming brown membr. trifi. brets, Cal. bilab., Keel shorter than wings 19175 Flowers axillary and racemose, Leaves cuneated linear obtuse glauc. glab., Stipules and bracts small, Calyx like that of Euchilus
[in the adult state reflexed, Stips lin., Branches villous 19176 Flowers sessile solitary axillary, Leaves ovate-acute pungent villous beneath when young, but only on the edges
[mucronate, Keel subrostrate shorter than wings 19177 Glaucous erect, Leaves linear terete upper ones verticillate dilated towards the points hatchet-shaped 2-nerved [ered shorter than leaves bracteate at base, Branches incurved twiggy 19178 Leaves spatulate lin. nerved apic. by a sott mucrone with a thickened edge, Racs axillary solitary about 4-flow19179 Glab. Branches erectish, Lvs terete striated linear-subulate stiff spinescent at top, Brnchs 4-5 times shorter than leaves, Keel obtuse [flowered equal to the leaves 19180 Glabrous, Branches angular, Leaves linear oblong subfalcate spinescent short thick substriated, Racemes many19181 Glab., Branches terete striated or angular leafless, Florif. brnchs mutic min. bracteate, Sterile ones bi-trichot. spinescent at top, Racs term., Calyx bilabiate, Upper lip broad truncate, Lower one acutely tripartite
19182 Glab. glauc., Brnchs terete, L,vs obl. 4-sided flat vertical fixed by the lower angle, inner angle rounded, outer angle spinescent, Spine of upper one tending upwds of lower one downwds, Racs many-fiwd longer than lvs.

and Misceiluncous Particulars.
The species are all pretty when in blossom. Like all leguminous shrubs, they make better plats when raised from seed than by cuttings.

19192
 －

19183 Lvs linear-lanc. strongly nerved obtuse and mucronate coriaceous smooth, Peduncles few-flowered axillary 19184 Leaves cordate stem-clasping reticulated, Peduncles axillary aggregate corymbose many-fiowered
[verticillate
19185 Branches villous, Leaves linear mucronate with revolute edges, Flowers numerous and appearing as if they were 19186 Leaves small fan-shaped narrowed on the short petioles deeply multifid at top, the segments spiny

19187 Leaves opposite spatulate oblong obtuse subcrenate mucronate sessile silky beneath, Racemes capitate 4-5-fwd terminal, Calyx reflexed

19188 Leaves calyxes and fruit downy, Leaflets oblong retuse, Petioles unarmed, Legume stipitate obtuse
19189 Leaflets glabrous oval emarginate, Petioles armed a little puberulous, Calyxes smoothish, Legume glabrous curved obtuse
19190 Leaves alternate with \(2-3\) pairs of large oblong retuse rather coriaceous opposite leaflets and an odd one, Young leaves and branches covered with rusty down, Panicles terminal
[with ligulate segments, Claws of petals connate
19191 Leaves impari-pinnate with 2-3 pairs of stalked cordate-lancenlate acute entire downy leaflets, Calyx downy 19192 Leaves cuneate at base triangularly 3-lobed at top somewhat 5-lobed, Pedicels solitary axillary 1-flowered

19193 Leaves elliptic acuminated stiff shining with revolute edges, Calyxes and petals smoothish
19194 Leaves impari-pinnate with two pairs of nearly opposite leaflets, lowest pair nearly cordate, upper pair oblong ovate, term. one much larger on a long petiole and occasionally lobed, Racs axil. few-flwd, Pedicels bibracteate

19195 Branches trigonal, Leaves ovate-lanceolate entire full of pellucid dots, Peduncles axillary l-flowered
[Peduncles bibracteate, Filaments hispid, Petals oblong
19196 Leaves spreading ovate obtuse mucronate sessile, Branches round pilose, Flowers axillary on short peduncles,
19197 Leaves linear acute many-veined dotted, Peduncles 1-2-flowered, Petals oblong
19198 Branches downy, Leaves oblong obov. glauc. mucron. dotted beneath, Peduncs solitary 1-flwd, Filaments ciliated 19199 Leaves linear-lanceolate entire smooth dotted with glands mucronate, Branches round, Peduncles axillary bifid 3 -flowered, Filaments a little fringed on the margin
19200 Jeaves lanceolate marginate mucronate dotted, Peduncles axillary 3-flowered, Filaments bearded
19201 Leaves lanceolate entire covered with yellow rufous or silvery scales beneath, Branches angular, Peduncles axillary trifid 3-flowered, Stamens exserted

19202 Much-branched, Leaves opposite trifoliate smooth, Leaflets lanceolate serrated slightly warted paler beneath, Peduncles terminal trichotomous many-flowered, Bracts subulate

19203 Leaves oblong-ovate obtuse a little scabrous covered with stellate tomentum beneath, younger ones rather rusty
19204 Leaves pinnate, Leaflets roundish deeply toothed, Petals entire

19205 Prostrate, Leaves ovate-oblong flat smooth

19206 Lts lanc.-acute clothed with rusty toment. beneath, Limb of Cal, short callous 5-lobed, Ovar. toment. 5-celled 19207 Not yet described that we know of ; it grows in woods at Monterey, and was introduced by Mr. Hartweg

and Miscellaneous Particulars.
3016. Biebersteinia. This singular plant is beset with glandular hairs. It requires to be grown in pots among other alpines. It can only be increased by seed.
3017. Ammýrsine. The species grow best in a peat border, and they may be propagated by layers or cuttings from young wood.
1014. Rhododéndron. This genus is the most prominent in the Sikkim Himalayas and Nepal. Seedlings have been reared in quantities from seed sent home by Dr. Hooker ; but the plants will all probably require protection in severe weather in winter. Many of the specips resemble each other in the foliage, particularly in the young state; but, nevertheless, they are distinct in the flowers and fruit. according to Dr. Hooker. They grow at elevations varying from 8000 to 16,000 feet; hut it is especially between 10,000 and 14,000 feet the genus prevails; several species, comprising three quarters of the bulk of the vegetation. The wood supplies the natives with fuel, and from its tough nature and property is easily worked into many domestic utensils, as spoons, bowls, \&c. The bark is used like that of the birch in the arctic regions; and the leaves serve as plates and wrappers for butter, cream, cheese, \&c. At the elevation of 13,000 feet, the snowy mountains glow with the blood-red blossoms of the \(\boldsymbol{R}\). fulgens, whilst the beauty of

History，Use，Propagation，Cuuture，
the \(R\) ．campanulatum，and the great elegance and delicacy of the \(R\) ．campylocârpum，excite the more admiration from their being found in the region of fog and rain．It has been insisted that many of the so－called species are of hybrid origin；but this is by no means clear，nor can it be ascertained．Some species are parasitical on trees，but these have been found growing even in clayey soil．They will readity grow in vegetable mould．

Rhododéndron ciliatum has passed the winter in the open air，surrounded by a bank of earth \(1 \frac{1}{2}\) foot high；but it flowered in the cool part of a greenhouse．
\(R\) ．javãicum is one of the most beautiful plants yet introduced；bist it requires the protection of a greenhouse．

19208 Leaves small ovate or obovate-elliptic pointed crenate dark green above and clothed with short shaggy wool beneath, Racemes about 5-flwd terminal, Peduncles shaggy
19209 Leaves lanceolate acute rusty beneath, Calyx woolly, Segments of Corolla 2-lobed with curled margius \(\beta\) A hardy evergreen hybrid, Flowers white, two upper petals spotted
19210 Glabrous, Leaves oblong-obovate coriaceous acute lepidoted beneath, Flowers umbellate, Calyx obsolete, Corolla funnel-shaped, Segments of Limb obovate

19238 Glabrous, Branches angular, Leaves elliptic cordate obtuse or retuse mucronate coriaceous marginate, Racemes axillary solitary pedunculate, Flowers secund, Corolla ovate, Teeth of Limb small erect

\section*{and Miscellaneous Particulars.}
3018. Bryánthus evéctus is said to be a hybrid between Phyllódoce taxifolia and Rhododéndron Chamacistus. grows best where the sun does not shine. It thrives well in damp, cold, shady pits.
3019. Thibaúdia pulchérrima will grow well in a conservatory border, or in a Camellia-house or greenhouse, trained against a wall. The flowers appear on the year-old wood, developing at Christmas, and expanding in April, and are beautifully variegated, like those of Fritillaria Meledgris. The other species will thrive with the same treatment.
3020. Leucóthoë. This is a splendid genus of hardy greenhouse shrubs, with racemes of scarlet flowers. They thrive best in light peat soil, well drained; and they prefer a cool shady place in summer. Propagated by layers

History, Use, Propagation, Culture,
3021. Lydnia. The hardy kinds of this genus are best grown in a peat border, along with other American plants. They are increased by layers put down in spring. The tendererkinds, as the jamaicénsis, require to be protected from frost in winter. They are all ornamental, and therefore desirable evergreen shrubs.
3022. Agarista is a splendid genus of tender shrubs. They grow best in a warm part of a greenhouse, in a mixture of loam, peat, and sand; and cuttings of ripened wood will strike root under a hand-glass in the same kind of mould.
3023. Gaylussacia Pseùdo-V'accinium is a very handsome, hardy, greenhouse shrub, with racemes of scarlet flowers. It should be grown in a compost of sand, loam, and leaf mould, and treated in the same way as Cape Heaths. It is propagated by layers as well as by ripened cuttings.
3024. Macleania. The species require a warm greenhouse, and are splendid shrubs while in blossom. A mixture of sand, loam, and peat will suit them. Owing to their producing large fleshy roots, a large pot or tub will be required;

10239 Glabrous, Branches terete, Leaves cordate oblong mucronate pungent coriaceous, Racemes axillary and terminal erect, Flowers secund, Corolla urceolate 5-parted

19240 Covered with scale-like dots, Branches angular, Los oval-lanceolate slightly serrate coriaceous, Flowers axillary numerous fasciculately subracemose, Corolla ovate, Ovarium hairy, Anthers bifid at top

19241 Leaves cordate-ovate mucronate downy rusty beneath, Panicle terminal downy composed of racemes, Flowers secund
19242 Lvs lanceolate attenuated white beneath, Racemes simple glabrous, Flowers secund, Corolla pale green inclining to purple

19243 Glabrous or downy, Livs elliptic lanceosate, Racemes secund erect bracteate, Corollas ovate cylindrical, Ovarium glabrous or nearly so
[late, Limb spreading
19244 Leaves sessile cordate obtuse dotted coriacenus, Peduncles glomerate axillary and terminal, Corolla urceo19245 Leaves ovate obtuse, Axils 3 -flowered, Corolla urceolate pentagonal
19246 Leaves sessile oval-oblong obtuse reticulated obsoletely triple-nerved, Axils 3 -fiowered, Corolla cylindrical angular
19347 Prostrate hispid, Leaves cordate-ovate acute ciliately serrated rather hispid beneath, Racemes terminal and axillary beset with glandular hairs, Bracts ovate coloured, Cal, coloured pilose, Cor, ovate, Limb spreading
[ate, Bracts coloured
19248 Clothed with rusty hairs and glandular pili, Leaves ovate acute mucronate serrated, Racemes terminal bracte-
19249 Procumbent filiform bristly, Leaves cordate mucronate nearly sessile naked above hispid beneath, Pedicels axillary short solitary, Flowets drooping
19250 Downy, Leaves oblong entire or slightly serrated with a hard firm reddish edge, Flws disposed in short pyramidal panicles, Peduncles glandular and woolly, Calyx smooth, Corolla ovate
19251 Leaves resembling the Caméllia in form but A'rouths in texture, Flowers small pure white
19252 Leaves oblong acuminate at both ends acutely serrated glabrous, Racemes axillary secund sessile solitary
19253 Arborescent, Leaves broad-oval quite entire glabrous on long petioles, Racemes axillary and terminal panicled dense-flowered
[1-nerved, Pedicels axillary solitary 1-flowered naked
19254 Erect-branched, Branches pubescent angular, Leaves linear-lanceolate acuminate remotely serrated glabrous
19255 Dark green, Branches setose, Leaves ovate-lanceolate acute denticulated and ciliated with bristles, Peduncles glandular, Berries red
19256 Erect, Bark deciduous, Lvs lanceolate acute sharply serrated glabrous glaucescent beneath, Racs paniculately branched pilose
19257 Erect downy while young, Leaves oval or oblong coriaceous mucronately pungent entire, Racemes short terminal, Bracts acuminated
[minate shorter than the pedicels
19258 Erect tomentose, Leaves linear-oblong entire mucronate green rusty beneath, Racemes panicled, Bracts acu. 19259 Erect tomentose, Leaves linear-lanceolate, Flowers racemose

19260 Leaves obovate obtuse 4 inches long clothed with white down beneath, Racemes panicled
19261 Leaves obovate-lanc. acute denticulated wrinkled above tom. ben., as are the petioles, younger ones rusty, adult ones hoary, Racs loose so crowded as to appear panicled tomentose, Lobes of Corolla toothed ciliated
19262 Clothed with rusty hairs, Leaves oblong quite entire acuminated excavated at base, Racemes simple fascicled at tops of branches

19263 Leaves linear pinnate bipinnate or entire, Segment filiform undivided, Peduncles Iong, Petals bearded at base, 19264 Leaves corrugated pinnate, Segments sessile ovate acute entire or 3-lobed, Peduncles Petals bearded at base

and Miscellaneous Particulars.
or probably, they will succeed well planted out in a conservatory border. Water should be freely given in summer. To have the plant furnished well with young shoots, it will be necessary to cut it back early in autum, in order to have the plant clothed with leaves before winter. They are difficult to multiply, but may be managed by cuttings under a hand-glass.
19247. Gaultheria bracteata should be grown in a light peat soil, and placed in a cool airy pit or frame, and in ummer it should not be exposed too much to the sun.
3025. Arctostáphylos. The hardy kinds are trailing evergreens, which grow best in peat soil, and are propagated by layering. The rest may be cultivated and treated like the species of Comarostáphylos.
3026. Comarostáphylos, like the common kinds of \(A^{\prime}\) 'rbutus, thrives best in a light sandy loam with a portion of leaf-mould. The species may be budded on the common A'rbutus in July or August.

History，Use，Propagation，Culture，
3027．Chariánthus coccineus is a splendid shrub when in blossom．It requires only the treatment of other hothouse Melastomaceous shruhs．
3028．Meriania．These two species are the white and red roses of the mountains of Jamaica．They are splendid when in blossom in their native mountains．In this country they will thrive in a compost of loam，sand，and peat ； and half－ripened cuttings will strike root in the common way in the same kind of soil．
3029．Mcdinilla magnifica is a most splendid plant，with broad leaves，large coloured bracts，and panicles of pink flowers．It grows and flowers freely in a mixture of loam and peat．The pots should be well－drained，so as to allow water to be liberally given during the season of growth without the risk of the soil becoming soddened．It should also be frequently syringed over head．A climate that suits the pitcher－plant will answer this．The species are all remarkable for the beauty of their foliage，and the delicacy of their blossoms．They all require the same kind of culture．

3030．Heterotrichum mácrodon requires the treatment of other hothouse Melastomaceous shrubs．
3031．Lasiándra，The species are worth cultivating for the sake of their large panicles of showy purplish－blue

19265 Leaves oblong on short petioles glabrous as are the petioles and branchlets, Branches deciduous

19266 Branches tetragonal bristly, Leaves ovate acute entire scarcely 3-nerved bristly, Cymes terminal pedunculate few-flowered, Calyx hispid
19267 Downy while young but becoming glabrous, Branches nearly terete, Leaves oval acuminated entire 5 -nerved clothed with flocky down beneath or small dots
[solitary 1.flowered, Bracts 2 ovate-lanceolate entire, Lobes of calyx subulate at apex 19268 Glabrous, Branches subtetragonal, Leaves ovate-oblong acuminated 3 -nerved denticulated. Peduncles axillary, 19269 Glabrous, Branches terete, Leaves ovate-lanceolate 3 -nerved denticulated, Peduncles axillary solitary l-flwd Bracts 4 lanceolate denticulate, Lobes of calyx subulate at apex

19270 Branches compressed tetrapt, bristly at nodes, Lvs opp, coriac, glab. sess. obovate-obl. cordately stem-clasping cusp. at apex 3 -nerved, Panics term. elong, with the brnchs vertic., Bracts large coloured decid., Flws decid. 19271 Branches tetrapterous, Lvs nearly sessile 3-4 in a whorl rarely opposite oval-oblong 7-9-nerved, Peduncs terminal axil. nutant, Flws 6-10-androus [minate 5-nrvd green above, Panics thyrsoid term.pedunc. nutant
19272 Brnchs terete stuposely bearded at the nodes, Lvs opposite on short thick petioles elliptic-ovate coriaceous acu19273 Leaves opposite on short petioles oblong-lanceolate acuminate 3 -nerved, Cymes axil. or on the naked branches below the leaves, Flowers tetramerous, Anthers dark purple
19274 Branches acutely tetragonal smooth, Leaves sessile elliptic-ovate 5-nerved subcordate at base, Panicles terminal axillary erect, Bracts obsolete, Anthers dark purple

19275 Branches petioles and cymes covered with long fulvous hairs, Leaves opposite unequal cordate-ovate acuminate serrated 7-nerved, Cymes many-flowered, Stamens 16, Petals obovate-cuneated
19276 Branches compressed pilose, Leaves opposite oblong-lanceolate subcordate at base, Flowers panicled at top of branches, Calyx setose

19277 Branches tetragonal villous, Leaves oblong-lanceolate rounded at base 9-nerved silky beneath, Panicles terminal glandularly pilose as are the calyxes, Style villous
19278 Hispid, Leaves ovate-oblong glabrous wrinkled above pilose beneath 3 -nerved ciliated, Flowers about 3 together terminal, Pedicels short hispid, Bracts lanceolate ciliate, Calyx bristly
19279 Villous, Branches tetragonal, Leaves petiolate ovate-elliptic acute 5 -nerved entire setose above and clothed with silky villi beneath, Pedicels hispid axillary terminal, Calyx hispid, Bracts large coloured

19280 Stem creeping-branched hairy as are the petioles and peduncles, Leaves broad-ovate cordate 5 -nerved spotted hairy nearly entire purple beneath, Peduncles axillary, Flowers in unilateral cymes, Calyx hispid
9281 Clothed with adpressed rufescent lepidoted powdery down, Leaves oblong 3-nerved glabrous above, Cymes panicled corymbose trichotomous, Calyx globose, Limb slightly 4-toothed
[dense cymes, Filaments red, Berries red 9282 Brnchs slender bluntly tetragonal, Leaves subcorlaceous oblong acuminate shining above, Flowers terminal in 9283 Branches bluntly tetragonal, Leaves obovate emarginately apiculated green above, Cymes axillary at ends of branches, Bracts rhomboid, Filaments white, Berrjes reddish

9284 Flower spikes scorpioid, Scape almost black, Leaves greenish almost black shining
9285 Stem short fleshy, Leaves hairy oval 5 -ribbed oblong cordate green above and beautifully marbled with brown and white purple beneath, Scapes terminated by a spike, Flowers size of Cýclamen

9286 Leaves acinaciform, Style shorter than flower

and Misccllaneous Particulars.
owers. A compost of loam, sand, and turfy peat will suit them, and they require plenty of water while growing. he pots should be well drained by sherds.
3032. Pleroma. The plants of this genus are similar to the Lasiindra, and their culture is the same.
3033. Bertolonia maculaita is a pretty little creeping plant. It grows best in light soil, and is readily increased y cuttings. Abundance of water should be given during summer, or while the plant is growing.
3034. Tetrazggia. The culture recommended for Lasiándra will suit this shrub equally well.
3035. Olinia. These are greenhouse shrubs. They grow best in light rich soil, and cuttings root planted in ordinary way under a bell or hand glass.
3036. Eriocnema. These pretty plants are probably only annual. The leaves of E.marmoratum are green above, ad beautifully marked with brown stains and broken streaks of white, and on the under side rich purple. The lossoms are of a rich rose colour. The leaves of \(E\). \(\mathbb{Q}^{\prime}\) neum are greenish brown, almost black, and shining with quite metallic lustre. These two plants are very delicate. They are grown in peat, but require to be kept continually raded and damp. The treatment of the tropical Orchidea, such as Anoctochilus, would suit them.

3045. Quillàja saponària. This trec is quite hardy enough to stand nur milder winters, and ripened cuttings will probatly ront if planted in antumn. The hark of the tree is used in Chili for soap.
1076. Bejaria. The treatment given to Indian Azaleas will suit the strongest kinds, and that of Rhododéndron
}

19341 Root tuberous, Leaflets 3 obcordate bilobed downy beneath, Scape many-fiwd, Petals and Sepals pilose the latter bipinnulate at top, Style erect shorter than stamens
[toothed, Styles short diverging
19342 Lvs all radiating, Lfts \(7-8\)-oblong spatulate entire, Scape umbellate many-flwd, Stamens unequal longer ones 19343 Bulb simple, Leaves ternate, Leaflets fleshy obcordate violet beneath, Petioles downy, Scape 2-3-flwd, Sepals biglandular at apex, Styles short glabrous
19344 Lobes of Calyx constricted, Appendages of Petals short emarginate, Capsule ovate granular

19345 Leaves oval usually toothed
dehiscing by a terminal pore. Stigma simple, obtuse. Berry 5-celled, many-seeded. Seeds small, angular.
Order 6. DODECAGYNLA. 12 Stamens. 12 Styles.
3047. 1110r. ADdium. Calyx campanulate or turbinate, 6-12-cleft. Petals as many. Stamens same number as petals. Ovaria equal in number to the petals, immersed in the receptacle at base. Styles triquetrous, Stign:as acute, at length papillosely capitate. Fruit follicular, dehiscing at base. Seeds obliguely subpyriform.

\section*{MONOGYN1A.}

19346 Glabrous, Leaves oblong obtuse glaucous beneath, Racemes terminal and axillary, Pedicels somewhat fastigiate 19347 Branches villous, Lvs oval-acute densely imbricate with revolute margins glaucous beneath villous on midrib, Corymbs dense short, Peduncles covered with rusty tomentum, Calyx smoothish, Style exserted
19348 Brnchs downy hispid, Lvs slightly downy above, rusty tomentose beneath, Pans close term., Pedun. woolly hispid 19349 Leaves oblong mucronate glaucous beset with glandular hairs along the middle nerve on both surfaces, Racemes terminal heset with clammy glandular hairs
[Corymbs terminal simple beset with rusty glandular hairs 19350 Lvs elliptic nearly glabrous above, downy glaucous beneath, clothed with rusty toment. while young, clliated, 19351 Branches downy tomentose, Leaves oblong glabrous glaucous beneath, Corymbs large terminal, clothed with rusty tomentum

19352 Stem erect thready in the axils, Lrs subcylindrical obtuse, floral ones subverticillate, Flowers large terminal sessile, Petals 2 -lobed

19353 Suffruticose procumbent, Leaves crowded linear acutish pilose, Peduncles elongated bearing a few distant small leaves, Corymbs terminal many-flowered, Bracts ciliated, Stamens 18-20
19354 Caulescent branched, Leaves obovate-oblong acuminated, Flowers panicled, Pedicels 5 times longer than bracts, Stamens \(10-15\)
19355 Leaves nearly opposite or alternate lanceolate-acute smaller than those of \(H\). salicifolia, Flowers nearly sessile, Capsules globose

19356 This plant is mentioned in the Gard. Chron. as having been lately introduced
[spurred obliquely 6-toothed, Stamens 11, Two upper Petals large roundish, and 4 lower minute 19357 Downy suffruticose, Leaves oval opposite sessile entire, Racemes panicled bracteate, Calyx coloured bluntly
19358 Flowers crimson or deep purple. Distinguished from Cuphea Llàvea by its panicled flowers
19359 Ascending clammy hispid from brown hairs, Leaves opposite oblong-lanceolate obtuse hairy, Flowers subspicate secund, Calyx tubular, Petals roundish stipitate, 2 larger than the rest
19360 Suffruticose, Branches compressed, Leaves petiolate oblong-acuminate rather scabrous, Pedicels winged, Calyx scarlet elongated 6-toothed, Spur dilated, Anthers black, Filaments smooth
[obovate large, Stamens 11
19361 Stems numerous hispid, Brnchs ascending, Lvs nearly sess. ov.-lanc. strigose, Pedunc. inter-foliac. Pets few
19362 Decumbent or erectish downy, Leaves ovate lanceolate, Peduncles generally 2-flowered subracemose, Calyx clammy, Spur blunt, Petals 2, Stamens 11
19363 Leaves ovate-acuminate covered with white bristles, Flowers solitary axillary on short pedicels, Calyx long A Flowers purplish
[tubular, Petals 2 vermilion, Stamens enveloped in a purple woolly substance

and Miscellancous Partictelars.
sctosum the weaker. A damp atmosphere, and a free circulation of air, are necessary, but they are of difficult cuiture. They are splendid plants in blossom when well grown.
3046. Ceratostèma. Pretty shrubs, nearly allied to Bejaria, and requires the same culture.

\section*{P. 408. Class XII. - ICOSANDRIA. Stamens many, perigynous, or inserted into the Calyx.} Order 1. MONOGYNIA. Many perigynous Stamens. 1 Style.
3048. 1111b. Echinópsis. Tube of Perianth much prolonged beyond the ovarium. Sepals numerous; lower ones scale-frmed; upper ones elongated, spirally imbricate, setigerous in the axils, petaloid, longer, more or less spreading, emulating a funnel-shaped or campanulate corolla. Stamens in two series; one of the series inserted in the bottom of the tube, the other series connate with the tube. Style filiform. Stigma many-rayed: Rays linear. Berry scaly, setose in the axils.
3049. 1111c. Leuchtenbérgia. Sepals numerous, adnate to the ovarium at the base, and combined into an elongated tube; outer ones calycine; inner ones petaline. Stamens numerous, concrete with the tube. Style thick, columnar. Rays of Stigma about 10 , recurved. Ovarium 1-celled. Ovula numerous, parietal.
3050. 1112a. Lepismium. Sepals adnate to a pear-shaped ovarium, and combined into a short tube; outer ones 4-5, subimbricate; inner ones \(5-7\) petal-formed. Stamens filiform, in many series. Anthers minute, reniform. Style columnar. Stigma 4-5-rayed. Ovarium subglobose, smooth, crowned by the dry calyx.
3051. 1115a. Billotia. Tube of Calyx rather turbinate: Limb 5-cleft: Lobes valvate. Petals 5. Stamens 10 30, free, shorter than petals. Style filiform. Stigma capitate. Capsule 3-celled, many-seeded.
3052. 1115b. Babingtonia. Calyx turbinate : Limb 5-cleft, persistent. Petals 5, sessile, orbicular. Stamens 15 ; 3 opposite each petal. Anthers roundish, didymous, opening by a pore at apex. Ovarium 3 -celled, many-seeded. Capsule perforated at apex.
3053. \(1115 c\). Lhótskya. Bracts twin, paleaceous, persistent, connate at base. Calyx with a 10 -ribbed tube, and a 5-parted limb: Lobes short, scarious, obtuse. Petals 5, obovate. Stamens numerous, unequal, exserted, inserted with the petals. Style filiform. Stigma dot-formed. Capsule oblong, 10 -ribbed, 1 -celled, indehiscent, 1 -seeded by abortion, the ovula being twin.
3054. 1115d. Bachhousia. Calyx turbinate, villous, covered with imbricate caducous bracts outside: Limb 5parted, petaloid. Petals 5, small, concave. Stamens numerous. Fruit dry, coriaceous. Ovarium adnate to the tube of the calyx at base, hairy. 2-celled.
3055. 1115e. Hypocalymma. Limb of Calyx 5-parted. Petals 5, unguiculate, orbicular. Stamens \(20-30\). Ovarium 2-celled, many-seeded. Style filiform. Stigma capitate.

> History, Use, Propagation, Cullure,

19391．Echinocáctus VisnăG．This wonderful plant was found in Mexico，at San Louic Potosi，and is one of the largest and most remarkable of the Cáctus family．In its native country it bears the name of Jisnàga，which signifies largest and mong the Mexican settlers，who use the spines for that purpose．The original plant，sent to the Royal Botanic Garden at Kew，was nine feet high，and nine and a half in circumference，and it weighed a ton．After a year of apparent health it exhibited symptoms of internal decay，the inside became a putrid mass，and the crust，or shell， fell in by its own weight．Other lesser ones are，however，in the collection at Kew．All the plants were procured with great trouble，by Fred．Staines，Esq．The nvarium is elongated and densely woolly，and furnished with soft prickles or scales at top，and the petals are serrated．

19376 Erect, columnar 12-14-furrowed spiral, Ribs and Furrows acute, Areolæ approximate naked, Prickles 8 fuscous straight, 7 radiating, central one 3 times larger and vertical, Flowers 3-4 terminal, Stigmas 9-12 linear
19377 Subglob.green 13 -angld, Ribs strong acutsh, Areolæ large obl. short-woolled, Out. 9 Prckls straight radiat., inner 4 strong, up. 3 straight, cent. one long flattened hooked [ment., Out. 10 Prickles slend. cent. 4 stronger 19378 Subglobose tuberc. hardly umbilicate, Tuberc, in 15 nearly vertical series confluent obl., Areolæ oval white to19379 Globose depressed 12-14-ribbed rather glaucous, Ribs obtuse, Areolæ white tomentose numerous, Prickles slender 12-18, of these 4-5 are twice the length of the rest, Flowers crowded, Petals serrulated
19380 Globose depressed obscure green 16 -angled, Ribs arched crenate, Areolæ immersed, when young white and very villous, Outer Prickles 9 spreading reddish, central one erect brown all straight
19381 Lrge ellip. many-ang. with nar. sinuses and deep sinuat. tuberc. angles, top very woolly, Areolæ approx. rhomb. immersed glab. pale brown, Prickles 4 strong, cent, one 2 in . long, the other 3 deflexed shorter, Flws copious 19382 Globose glaucous flat at top tuberculate, Tubercles hexaedrous disposed in two series vertical and spiral, Areolæ immersed tomentose, Prickles 7 radiating unequal, central one longer stronger
19383 Oblong many-ribbed, fascicles of spines approximate woolly at base, Outer Spines 20 - 40 weak white, central 3-4 purple stiff, Petals in 2 series serrated at top
19384 This is nearly the size of E. Visnàgo, and was sent to Kew Gardens along with it, but has not been described

19385 Ovate glob. 14-I6-ribbed, Ribs vert. obt., Areolæ large approx. ellip. woolly, Prickles acicular yellowish brown at top, outer ones 8 - 10 radiate 1 inch straight, central one very long 3 inches curved, Cal. rather scaly hairy 19396 Globose depressed green 17-ribbed, Ribs compressed, the Pulvinæ crestedly subrepand immersed rather crowded grayish tomentose, Prickles stiff, outer ones spreading, the central one longer, Flowers white
B Flowers purple

19387 Roundish cylindrical, Mamme broadi 19388 Glaucous roundish depressed contracted at base, Mammæ obtuse conical tetragonal umbilicate at apex, upper ones furnished with 3-4 erect acicular spines, the rest naked 19389 Simple nearly globose, Axils woolly, Mammæ crowded slender angular, Prickles 4 from the nearly naked are 19390 Simple clavately columnar glauc. green, Axils tomen., Mammæ large elongated angular, Areolæ tomen. term., Prickles straight elongated 8-10-12, central one longer and stronger, Flws 2-3 term. large, Pets ser, at apex
19391 Shrub fleshy cylindrical, Mammillæ elongated leaf-formed triquetrous truncate, lower ones deciduous, Spines glumaceous, outer ones shorter about 10 , central one very long triquetrous at base
19392 Erect with long joints glaucescent, Ribs deep 4 sometimes 3-5 compressed obtuse undulately repand, Areolæ remote white tomentose, Prickles stiff straight \(4-6-8\) unequal, outer ones stellately spreading brown
19393 Erect conico-cylindrical acutely 12-14-ribbed, Areolæ approximate tomentose usually 12 -spined, Spines and Prickles acic. short, cent. one 1 in . long, Flws brick-red, Scales of Cal. green at top bristly, Pets obov.-acute 19394 Erect cylin. many-angled glauc., Ribs outuse equal, Areolæ copious brown woolly, Spines numer, unequal 4-5 are stronger white all deflxd, Flws numer. orange-clrd, Scales of Cal. remote, low- ones cil., Stamens unequal 19395 Jointed radic. green triang., Angles repand obt., Areolæ remote nearly nak., Prckls very short straightish 2-3, Bristles short decid., Fls large with cylin. scaly tubes, Scales large elrd gradually changing to sepals and petals 19396 Erect bluish 8 -angled, Ribs blunt crenated, Areolæ approx., Prickles acicular of two colours rising from black tomentum, about 12 radiating, 3-4 central, the upper ones usually the strongest, Petals undulately toothed
19397 Subclavate green attenuated umbilic. at top, Kibs 13 vertical acute, Spines acicular, cent. 4 black at top and bottom, out. 9-10 shorter yellowish radiat. irregularly
[white radiat., cent. ones 2-4 brown hardly larger 19398 Erctsh-brnchd 8-ang, with broadsh sinuses and scarcely prom. ribs, Areo, approx., Out. Prckls 6-8 bristle-fmd 19399 Erect large 5 -angled with deep furrows, Spines numerous usually an inch long brown

19400 Erectish, Joints obovate truncate at both ends very blunt one-toothed having a cluster of hairs in the teeth \(\beta\) Corolla with equal spreading sepals, Ovaries \(4-5\) winged, Stamens monadelphous at base
19401 Branches straight compressed biconvex having the margin exactly crenated green, Flowers large white, Stigma 9-rayed
19402 Branches large flat foliaceous green obtuse having the margins repandly toothed and the teeth truncate

\section*{19403 Prostrate weak, Adult Branches terete younger flat articulated crenate, flowering ones lanceolate terete at base,} sterile ones oblong sessile, Sepals 4 narrow, Petals 4 broader, Stigmas 5

and Miscellaneous Particulars.
3048. Echinópsis comes very near to Echinocáctus, and the treatment and cultivation of the species are similar to that required by those plants.
3049. Leuchtenbérgia is a singular Cactean plant. Few persons, viewing it destitute of flowers, would imagine it to belong to Cáctea: the mammille have rather the appearance of leaves of some aloid plant; while the stem, appearing as if formed of the persistent bases of old leaves, resembles that of some Cycadeous plant. The blossoms differ in no particular from those of Cèreus. The propagation and cultivation are the same as those for Cèreus, but it requires more moisture, being a less succulent plant.

History，Use，Propagation，Culture，
3050．Lepismium is a genus composed of very singular plants in habit．They require the same treatment as the species of Cereus．
3051．Billotia．The species are pretty shrubs when in blossom，and are well suited for conservatory plants．A compost of loam，peat，and sand is the best soil for them．Cuttings taken from young wood root readily if planted in sand with a bell－glass over them．

3052．Babingtonia Camphorosmee is a greenhouse shrub，graceful in its habit，and not difficult to cultivate．It grows best in a rich brown peat and leaf－n：ould，and fowers freely during the summer months from the ends of pendent branches．Cuttings of young wood will strike root if treated in the usual way．
3053．Lhótskya is a genus of pretty heath－like plants．They are rather difficult to cultivate．A compost of ligh： loam，sand，and peat suits them best；and young cuttings will strike root if planted in sand，placing a bell－glass over them．

19404 Branches foliaceous stiff flat thick pinnatifid, Lobes almost rectangular triangles, Flowers brown outside and white inside, Sepals longer than petals, Stigmas 9-10
19405 Glaucescent articulated oblong compressed crenate, Scales in the crenatures larger than in the allied kinds, Rootlets numerous issuing from the joints, Flowers yellow outside but white inside

19406 Erect-branched pale green, Branches cylin., Areolæ crowded white tomen., older ones globose furnished below with 3-5 brownish prickles, Flowers glomerate, Petals obovate-lanceolate sulphur-coloured tinted with red
19407 Decumbent obovate green, Areolæ crowded laniferous, Prickles of two forms, upper ones setaceous yellow, lower 1 or 2 strong white
[bearded, Flowers on the lower branches terminal solitary, Style exserted 19408 Erect much-branched, Branches scattered terete articulated dotted, Joints of branches short, ultimate ones 19409 Trailing, Stem flat, Joints leafy roundish-ov. Alat hanging down 3 in . long 2 in . broad with a thick prom, woody midrib, Fls sol. sess. issuing from each crenat. pale brownsh yel. their buds tinged with pnk, Pets ov.obl. obr. 19410 Pendulous branches verticillate naked glabrous, Calyx 4-parted, Petals 4

19411 Plant diffusely suberect subarticulated, Joints elongated slender 3-4-sided, Margins acute crenulated purple, Crenæ remote furnished with white hairs and propped by foliaceous bracts
19412 Articulated erect subradicant pale green triangular, Ribs much compressed repandly crenated furnished with an ovate acute scale and numerous white hairs at the crenæ

19413 Leaves oval-elliptic acuminate denticulate downy beneath, Flowers racemose, Lobes of Calyx acuminated, Style 4-cleft at apex
[minate, Style deeply 5-cleft, exceeding the stamens
19414 Leaves ovate acuminate sharply serrate downy beneath, Flws solitary or by threes, Lobes of Calyx long acu19415 Branches pendulous, Branchlets downy, Leaves ovate acuta coarsely toothed pilose beneath, Racemes compart term, 5-9-flwd, Style 4-parted, Calyx spread. [brous above, Flws solit. or by threes term., Petals roundish
19416 Brnchs loose downy, Lis ovate-acuminate remotely denticulated or entire 3 -nerved hairy beneath at length gla19417 Leaves ovate-lanceolate acuminate slightly serrated, upper ones long narrow rather hairy beneath, Flowers solitary or in pairs terminal, Calyx smooth, Styles divided almost to the base
19418 Leaves lanceolate mucronate tapering to both ends, Calyx villous with coloured teeth, Bracts glumaceous permanent
19419 Flowers capitate, Leaves obovate edged with white 3-tierved, lateral nerves obsolete at apex
19420 Flowers capitate, Leaves linear-lanceolate 3 -nerved glabrous, Branches flexuous glabrous
19421 Branches crowded stiffish angular glabrous like the leaves, Heads axillary many-flowered silky villous, Leaves sub-distich ovate-elliptic or rndsh b-nerved veiny inflexed undul. complicate at apex mucr. glabr. on edges

19422 Leaves linear opposite nerved, Flowers in little cymes disposed in long terminal racemes

19423 Leaves linear triquetrous obtuse villous, Bracts obovate downy on the back with membranous margins equal to villous tube of calyx, Flowers capitate
19424 Leaves ovate acuminated with prominent nerves
19425 Leaves linear-lanceolate mucronate, Flowers axillary on short pedicels. Heads many-flowered
19426 Branches twiggy tetragonal, Leaves remote spreading decussate sessile linear-subulate channelled convex on the back mucronate, Flowers axillary twin sessile interruptedly spicate
19427 Leaves filiform plano-convex glandular mucronate, Flowers twin axillary sessile, Stamens exserted
19428 Scandent, Branches hoary, Lus qnadrifarious ovate-roundish obtuse coriac. shining with rev. edges beset with white scattered hairs on both sides dotted beneath, Flws in upper axils terminal, Peduncs short 3-flowered 19429 Lvs oval flat emarg., Flws crims. in clustrs with long crims. stams surrounded by a green cup-shaped wavy disk

and Misccllaneous Parliculars.
3054. Backhousia myrtifolia is a large shrub of an elegant habit well fitted for a conservatory plant. Cuttings of young wood will strike root in sand by the ordinary method.
3055. Hypocalymma is composed of pretty greenhouse shrubs. The leaves smell of lemon when bruised. The plants should be potted in a compost of loam and heath-mould, with a small portion of silver sand. The pots must invariably be well drained, and water should be freely given during summer. They may be propagated by young cuttings.
1117. Metrosidèros robusta is said by Mr. Allan Cunningham to be the Ratu of the New 'Zealanders, and is a noble tree, usually attaining the height of 80 or 100 feet. The wood is hard, close-grained, and very durable ; and hence admirably adapted for ship timbers, and in the construction of agricultural implements. The leaves have a rich aromatic odour. The plant flowers in our greenhouses at the height of 3 or 4 feet. Metrosidèros tomentòsa grows best in a rich vegetable soil, but is not hardy enough to stand our winters in the open air. Metrosidèros buxjolia climbs like ivy in its native country.

1128．AMY＇GDALUS．
7020 Pérsica

History，Use，Propagation，Cullure，
305fi．Angóphorc is a genus of beantiful broad－leaved shrubs or trees with large terminal flowers．They answer well as conservatory plants．A mixture of sand，loam，and peat is the best soil for them．Cuttings of them are difficult to strike．These should be taken from ripened wood，and planted in sand，placing a bell－glass over them．
3357．Callisièmon．All the species are worth cultivating in every collection of greenhouse plants，for the neatness of their foliage and the beauty of their blossoms．They are well adapted for conservatory plants．Ripened cuttings strike root in the ordinary way，under a hand－gliss．They may also be raised from seed，which is frequently produced in this country．Plants reared from cuttings taken from fowering plants come into flower when of a small size； but those raised from seed do not flower till they become large plants，
19439．Eugenia ternifolia is a fine stately species．It grows to a large tree．There are two varieties；one with white flowers，and the other with beautiful rose－coloured fowers．The fruit is edible．The leaves are very large； in fact，the largest of all the species．

19440．Engenia brasiliénsis，the fruit of which is brought to the markets in Brazil under the name of Grumi－ chama，has the young leaves above the flowers purplish－brown．Eugenia \(U^{\prime} g n i\) is the Murtilla of Feuillée，Obs． 3.

19430 Leaves oblong-ovate glabrous rather coriaceous, Corymb compound terminal, Calyx turbinate, Petals and Stamens scarlet, Fruit urceolate 5-ribbed
19431 Leaves elliptic coriaceous bluntish, glabrous above but clothed with cinereous tomentum beneath, as are the branches and cals, Corymb comp. term., Pedics 3-flwd, Cal. turbinately cylind., Petals minute, Caps, smooth
19432 A charming crimson-flowered bush
19433 Leaves sessile ovate cordate at base glabrous like the branches, Peduncles and Branchlets covered with bristly hairs

19434 Leaves linear-lanceolate stiff pungent beset with scabrous dots rather villous when young as well as branches, Calyx glabrous
19435 Leaves lanceolate tapering to both ends mucronate glabrous in the adult state but villous while young, Flowers distinct spicate nearly terminal, Calyx pilose, Petals downy ciliated
19436 Leaves lanceolate acute mucronate tapering to both ends glabrous in adult state downy when young, Spikes 19437 Branches downy, Leaves linear pungent channelled, Calyx tom., Petals unequal [long slender, Calyx piluse 19438 Leaves linear-spatulate obtuse spreading with white ciliated edges, Calyx downy

\section*{19439 Leaves large 3 in a whorl 6-15 inches long and 3-6 broad, Flowers lateral}
\(\beta\) Flowers rose-coloured
19440 Leaves oblong-obovate acuminate glabrous shining above full of dots, Peduncles from the axils of the upper scales opposite solitary l-flowered, Calyx bractless, Lobes ciliated, Petals 4 obovate
19441 Leaves ovate acute coriaceous dotless green above and pale beneath, Young Branches upper Leaves and Petioles downy, Peduncles axillary solitary l-flowered, Bracts and Calycine segments \(\mathrm{r} t\) flexed
19442 Leaves oval-oblong acuminated 3 -nerved, glabrous above downy beneath, Lateral nerves almost marginal, Peduncles trifid or twice trifid 3-7-flowered rather hairy as are bracts and calyxes [fld, Cal. glab., Pets dwny
19443 Leaves linear mucronate with scarlet edges downy beneath 1 inch long and 1 line broad, Pedics axil. solit. 1 19444 Leaves nearly sessile elliptic-orbicular coriaceous stiff glabrous with subreflexed edges, Pedicels short 1flowered axillary fascicled, Calyx bibracteate, Teeth of Calyx short, Petals orbicular concave
19445 Leaves 3-5-nerved very like those of a species of Melástoma

\section*{19446 A beautiful tree with pendent spikes of large white flowers}
[axillary 4-5-flowered pedunculate, Operculum small hemispherical umbonate 1944 Leaves alternate ovate-lanceolate petiolate marginate acuminate or obtuse mucronate, Umbels terminal and 19448 Brnchs tetrag., Lvs vertical elliptic green, Peduncs axil. solit.3-flwd compressed very broad, Cupula turb. on very short pedicel [culum hemis, herical subglobose broader than the calycine cup, Fruit splachniform 19449 Leaves alternate obliquely ovate-lanc. marginate feather-nerved coriaceous, Umbels terminal compound, Oper19450 Glaucous, Young Branches angular, Leaves alternate coriaceous dotted marginate uncinately acuminated, Corymbs terminal many-flowered, Pedicels compressed 2 -edged, Operculum hemispherical umbonate
19451 Leaves alternate lanceolate almost falcate, Peduncles axillary short l-flowered, Operculum conical length of cup which is tetragonal, but in the adult state it is depressed and mucronate in the centre
19452 Glaucous, Leaves opposite elliptic-cordate coriaceous acum. sess., Peduncs axil. solit. short 1-flwd, Calyx large thick, Operc. conico-hemispher. acuminated, Capsule large depressed hemisph. marginate woody 4 -5-valved
19453 Leaves narrow-lanceolate tapering to both ends acuminate-mucronate, Peduncles axillary and lateral nearly terete, Umbels 6-8-flowered, Lid hemispherical almost mutic shorter than cup
§ Flowers dark crimsun semidouble
E Flowers single pure white
\% Flowers pure white and full semidouble
n Two or three fruits are often produced by one flower.

and Miscellaneous Particulars.
p. 44. t.31. It has the habit of our common myrtle, and grows in the Bay of Valdivia. The natives call it \(U^{\prime} g n i\), and the Spaniards Murtilla or Myrtilla. The petals are orbicular, very concave and forming, as it were, a globose corolla white tinged with red.
19444. Mýrtusorbiculàta is called Medlar-wood in Madagascar. It requires considerable heat and a moist atmosphere. A compost of sand, peat, and loam suits it well. The pot in which it is grown should be well drained. Cuttings from ripened wood strike root under a hand-glass in a moist heat.
19447. Eucalyptus calophÿlla has the leaves 4-6 inches long, pale green with a rich red marginal line, within which runs a faint intra-margitial vein. The veins are simple and pinnate; and the whole appearance of the foliage is that of a Calophyllum. The flowers are large and white.
19450. Eucalyptus coccifera has been cultivated in the gardens for many years, so that it is now more than 20 feet high; and might perhaps be hardy in sheltered situations. The leaves have the smell of myrtle when bruised.
19451. Eucalýptus glóbulus grows in its native place from 100 to 200 feet, aud has been seen as tall as 330 feet, which must be an enormous tree, and is called Blue Gum Tree,

History，Use，Propagation，Culture，
3058．Cérasus ilicifolia is a small evergreen bush，first found by Nuttall，then by Coulter，and lastly by Hartweg， who reports the frut to resemble a small cherry．The leaves are like those of the holly，and the flowers like those of the bird－cherry．The species of Pruntes from 7026．to 7043．belong to the genus Cérasus．

19461．Crate＇gus Cetsiana．This species is perfectly distinct from C．tanacetifolia and C．orientalis．The tree is more robust；the leaves are larger and more deeply cut；the habit is also more fastigiate．The fruit is larger，and the tree flowers much later in the seasou．It was first noticed by Dumont de Courset．

3059．Lindleya mespiloz̀des is a small tree with the habit of Mespilus grandifidra，and with flowers as sweet－scented as the hawthorn，and it may be propagated by graiting on it．It requires protection in severe weather．

\footnotetext{
\(\beta\) Lobes of Calyx lanceolate length of tube, Style enclosed hardly tomentose at base
\(\gamma\) Lobes of Calyx length of tube, Petals narrower longer and white, Style scarcely tomentose at base, Leaves broader
}
\(\delta\) Leaves narrower than in the other varieties
19454 Leaves ovate acuminate glabrous shining, Peduncles solitary, Lobes of Calyx shorter than the tube
\(\beta\) Flowers semidouble white
19455 Leaves obovate acuminate setaceously serrulated glabrous, Petioles glandular, Flowers in fascicles
[dular length of petioles, Petinles glandless 19456 Flowers usually solit. shorter than leaves, Leaves obov. acuminate glandularly srrate glabrous, Stipules glan-
[Racemes leafy elongated many flowered, Fruit ovate roundish 19457 Leaves ollong-elliptic cordate at base acuminated reticulately veined serrated glabrous, Petioles often glandular \({ }_{2}\) 19458 Lvs lanc. acuminated bluntly serrated glabious pilose in axils of veins beneath, Peduncles short rather villous 19459 Leaves coriaceous shining cordate-ovate on short petioles spiny-touthed, Racemes axillary and terminal denseflowered, Bracts shorter than pedicels

\section*{DI.PENTAGYNIA.}

19460 Spinescent evergreen, Young Branches tomentose, Leaves narrow oblong shining crenately serrated, Corymbs terminal, Calyx glabrous with rounded segments, Styles 5 glabrous, Pome depressed globose red
19461 Leaves hairy pinnatifidly cut, Sepals reflexed, Styles 5, Fruit large yellow

19462 Glabrous, Leaves scattered simple crenulate, Stipulas petiolar twin, Flowers axillary solitary pedunculate at the tops of the branches
[Bracteolestoothed, Calyx silky
19463 Leaves cordate-ovate and 3-lobed doubly serrated, Stipules leafy serrated, Racemes spicate terminal thyrsoid, 19464 Leaves cordate 3 -lobed acuminated doubly serrated, Stipules entire membranous, Racemes terminal solitary; Bracts entire, Calyx tomentose
19465 Leaves linear pointed sometimes 2-3-lobed rising in fascicles, Flowers small in terminal panicles
19466 Leaves glabrous oblong mucronate narrowed at the base, Racemes many-flowered glabrous, Segments ovate acute petaloid serrated, Carpels naked
19467 Evergreen shining, Branches prostrate intertwined, Leaves linear-obovate obtuse with recurved edges downy beneath, Fruit sessile solitary recurved, Petals minute

[late, Sepals villous inside
19480 Leaves lanceolite 3-lobed and pinnatifid glabrous glaucescent beneath, Racemes corymbose terminal peduncu-

and Miscellaneous Particulars.
3060. Neillia will, perhaps, prove quite hardy shrubs. They will grow in ordinary soil, and will strike ront from cuttings planted in autumn. They will prove a good addition to our shrubberies.
3061. Adenóstoma is a hardy small evergreen heath-like bush, with small white flowers. The leaves are in fascicles in the axils of the primordial ones, which fall off early, and leave a pair of spine-pointed stipules behind. Their culture is the same as that for Spiræ゚ \(a\).

Adenóstoma fasciculatum is a pretty little shrub with the habit of Spiree \(a\), will grow well in common soil, and is increased by cuttings.
3062. Nagelia is nearly related to Cotonerister, and requires the same culture.
 3063. 1141a. SCHIZONO'TUS Lindl. (Schizo, to cut, notos, the back; cell of capsule open at Uack.) Rosacea. 19482- - tomentosus Lindl. woolly Spirce'a Lindleyàna Wall-, as well as Spirce'a sorbifolia L. No. 7142., belongs to this genus.

Page 456. Class XIII.-POLY ANDRLA. Stamens many, hypogynous, or inserted under the Ovary.

\section*{Order 1. MONOGYNIA. Stamens many, hypogynous. Style 1.}
3064. 1177a. Victoria. Sepals 4, deciduous. Petals numerous in several series, passing gradually into stamens, as in Nympha' \(a\), and united with them. Stamens numerous, united at the base, bearing the elongated anther-cells; the innermost stamens united into a monadelphous body and sterile. Ovarium 27-30-celled, and 10-12 ovules in each. Fruit a turbinate truncate berry, with a deep hollow disk, and a persistent central column.
3065. 1192a. Frexièra. Calyx of 5 sepals. Petals 5, broadest at the base. Stamens free. Anthers smooth, sometimes cordate. Style 3-5-cleft at apex. Berry dry, 3-5-celled. Cells many-seeded.
3066. 1192b. Frièsia. Calyx 4-parted. Petals 4, 3-lobed at apex. Anthers 12, cordate-oblong, acuminate, dehiscing at apex. Berry dry, somewhat stipitate, indehiscent, 2-4-furrowed, 2-4-celled. Cells 2-seeded.
3067. 1192c. Sauratija. Calyx 5-parted. Petals 5, connected together to their middle. Stamens many, monadelphous at the base. Styles \(3-5\), sometimes connected at the base. Berry furrowed, filled with shining pulp, with as many cells as there are styles. Seeds minute, angular.
3068. 1196a. Pachystigma. Calyx subtriphyllous. Sepals unequal, concave. Petals 4, conform, free, concave. Stamens numerous, inserted by two series on a fleshy gynophore. Ovarium globose, 7-8-furrowed, 7-8-celled. Cells biovulate. Stigma large, 7-8-lobed. Capsule at length dividing into \(7-8\) parts, stellately disposed. Parts lseeded by abortion.
3069. 1198a. Luxemburyia. Calyx of 5 unequal sepals. Petals 5, unequal. Anthers nearly sessile, definite or indefinite, inserted on a short gynophore along with the pistil, bursting by two pores at apex, aggluminated into a

Hisiory, Use, Propagation, Cullure,
3063. Schizonotus is azgenus separated from Spirala. They are well suited for ornamenting shrubheries. The well-known Spire'a sorbifolia is the type of the genus. S. tomeatosus, in severe frost, is usually killed to the ground.

19481 Leaves simply palmate upper ones subhastate or lancenlate, Petioles appendiculate, Flowers corymbose, Sepals reflexed pilose, Carpels hairy parallel, Styles subcapitate
\(\beta\) Leaves tomentose beneath, Segments usually acuminated
19482 Leaves pinnate 5 - 8 pairs, Leaflets sessile ovate-lanceolate acuminate coarsely and doubly serrated, Stipules linear, Racemes forming a pyramidal panicle

\section*{POLYGYNIA.}
[tioles prickly, Stipules narrow ent. with gland. edges free and subulate at top, Sepals entire. Flws clustered 19493 Glab. scand., Brnchs setig. gland., Lvs tern. rarely pinnate, Lfits ov-lanc. acum. sharply ser. glauc. ben., Pe19484 Prickles crowded nearly equal, Peduncles beset with curved prickles

mass on one side, usually clasping the ovarium. Style declinate. Stigma simple or tripartite. Ovarium sessile, oblong, triangular. Capsule 1-celled, 3-valved, many-seeded. Valves bent inwards, and bearing the seeds on the edges. Seeds oblong, girded by a membrane, which is broadest at top.

\section*{Order 3. TRIGYN1A. Stamens many, hypogynous. Styles 3.}
3070. 1198b. Consólida. Sepals 5, coloured; upper one infracted, unguiculate, spurred. Petals 2, joined ; inner spurred, lobed, thrust in between the sepals. Stamens declinate. Carpel solitary.

\section*{Order 4. POLYGYNIA. Stamens many, hypogynous. Styles many.}
3071. 1212a. Smeathmánnia. Calyx 5-leaved. Petals 5. Nectarium 1-leaved, urceolate, surrounding the stamens at hase. Stamens numerous, distinct, seated on a short column. Anthers incumbent. Stigmas 5, peltate. Capsule inflated, 4-5-valved, sessile, many-seeded. Seeds dotted.
3072. 1224a. Laplàcea. Calyx 5-leaved, Corolla 5- or many-petalled. Petals generally unequal. Stamens indefinite. Styles 5, or more. Stigmas simple. Capsule woody, 5 -lo-celled. Seeds biseriate, and many in each cell, winged at top.
3073. 1233a. Cathcártia. Calyx 2-leaved, caducous. Petals 4, roundish, deciduous. Stamens 25-30. Filaments filiform. Anthers 2-celled, terminat. Stigma fleshy, 5-6-rayed. Capsule erect, silique-formed, 1 -celled, \(5-6\)-valved. Seeds numerous, compressed, scrobiculate.
3074. 1233b. Eucryphia. Calyx 5-parted. Styles usually 12. Petals 5. Anthers didymous. Capsules ovate, uith boat-shaped cells hanging by funicles.

and Miscellaneous Particulars.
19487. Potentílla ambígun is a small shrubby species, increasing by the rooting stolons or runners
19493. Calycánthus occidentalis is a fine species, but ratner tender. The flowers are of a brownish red, with a ubacid unpleasant odour.

History，Use，Propagation，Culture，
19499．Meconopsis Wallichiz is a pretty blue－flowered poppy from the Sikkim Himalayas．The fowers are large， and droop；they are disposed in long leafy racemes．The plant was grown in pots in a frame，but will，perbaps， succeed well in the open border．
19500．Sarracenia Drummóndi．The stove is said to be the most suitable place for this plant at a temperature of \(80^{\circ}\) to \(100^{\circ}\) ，among Orchidece and Epiphytes，at least at that time when they are making and maturing their growth， at which time they require much warmth and moisture．The other species would require the same treatment．They are all inhabitants of the swamps of a region which during the summer experiences a tropical heat．
19501．Nymphe＇a élegans will probably grow and flower in the open air．The flowers are very sweet－scented． It comes near to Nymphé a ámpla．
19503．N．dentàta is very common in ponds in every pawt of Guinea，along with Pistia Stratiotes．The root of \(N\) ． ampla is composed of round tubers．The leaves of \(N\) ．gigante a are 2 feet across，and the root is composed of tubers． \(N\) ．Devoniénsis appears to be only a strong seedling plan：of N．rubbra，and is not a hybrid．
3064．Victoria règia．This splendid water－lily has been found in the rivers Amazon，De la Plata，Berbice，and in the river Yacuma，a tributary of the river Marmora，in Bolivia，and probably in many other lakes and rivers in South America．The plant flowered first at Chatsworth，the seat of the Duke of Devonshire，under the care of Sir Joseph Paxton；at Sion House，under the care of Mr．Iveson；and at the Botanical Gardens，Regent＇s Park，and at Kew；and in the open air at Mr．Weeks＇s Nursery，King＇s Road，Chelsea．The whole plant is prickly，except the

\section*{MONOGYNIA.}

1949 Leaves few remote pinnate, Lower segments ovate cut subpetiolate, Upper ones linear entire subconfluent, Capsules smooth
[ments ovate cuneate, Upper linear cuneate, Capsules smooth 19498 Stem leafy at base, Leaves thickish glaucous pinnate, Segments deeply lobed with revolute edges, Lower seg19499 Tall glaucescent bristly from long rufescent hairs, Radical leaves petiolate pinnate but pinnatifid towards the apex, Lobes sinuate, Caul. lvs obl. sinuate pinnate sess., Flws nodding large in long leafy racs, Ovar, bristly
19500 Pitchers long straight dilated upwards ang. tapering much to base furnished with a sharp projecting rib in front with an undulated inflexed roundish blade which is covered with long hairs inside, Flowers purple
19501 Leaves nearly orbicular repandly toothed spotted with black and purple beneath with a narrow recess, Sepals 4, Petals white with a bluish tint, Stamens in 15 bundles, Outer Anthers appendiculate, Stigma 15-rayed 19502 Leaves small roundish-cordate entire, Petioles long slender, Lobes divaricate acuminate reddish beneath and dotted with violet generally bearing bulbs between the lobes. Stigmas 15 nearly sessile [pressed at base
19503 Leaves peltate sharply toothed glabrous the nerves very prominent beneath, Calyx 4-1vd vittate truncate de-
19504 Said to be a hybrid between N. ribbra and N. Lotus. The leaves and flowers are larger than those of the parents, Leaves strongly dentate, Flowers crimson
19505 Leaves peltate bluntly and sinuately toothed not dotted glabrous, Lobes incumbent, Anthers appendiculate at top, Stigma 20-rayed
19506 Leaves cordate roundish peltate toothed glabrous tubercled above and coloured beneath with a narrow sinus, Sepals dotted, Stigma 20-rayed, Anthers appendiculate, Outer ones long
19507 Lvs cordate peltate roundish thick remotely toothed, Flws large, Calyx 4-lvd, Petals numerous obtuse, Outer ones obovate, Inner ones linear-lanceolate, Stamens hiding the stigma, Anthers curved, Outer ones apiculated

19508 Plant prickly, Leaves large 5 to 7 feet in diameter and 20 or more in circumference, Flowers large more than a foot in diameter

19509 Leaves narrow oblong bluntly acuminate green above and pale beneath smooth, Peduncles solitary l-flowered hid among the leaves, Flowers dull greenish-purple
19510 Leaves elliptic-lanceolate acute serrately toothed tapering into the short petiole, Flowers nutant, Pedicels axillary nearly solitary 1-flowered, Anthers apiculated pencilled on the back, Style hispid at apex

1951 Leaves ovate-lanceolate serrated sometimes opposite and sometimes alternate, Flowers dronping on slender pedicels composed of 4-6 sepals and petals, the latter 3-cleft with 3 deep crimson stripes in the middle
19512 Branches peduncles and nerves of leaves clothed with adpressed rusty bristles, Lvs obovate-lanceolate petiolate doubly serrated, Panicle ample much branched, Petals obcordate
19513 Icosandrous, Leaves terete glabrous petiolate stipulate
19514 Icosandrous, Leaves terete petiolate downy stipulate
[villous
19515 Icosandrous, Leaves petiolate with two very short stipules scabrous in the adult state as well as brets, Branches
19516 Icosandrous hispid, Leaves linear petiolate keeled, Heads spherical, Floral Leaves villous, Bracts linear-lanceolate acuminate shorter than slender tube, Tails very slender twice as long as petals
19517 Icosandrous downy, Leaves imbricate oblong-obtuse ciliated, Brets with membranous edges mucronate shorter than the tube of calyx, Awns twice as long as petals
19518 Icos. glabr., Leaves linear-tetragonal obtuse imbricate papillose, Bracts obovate apiculate length of tube of Calyx, Tails a little longer than petals, Flowers axillary
[shorter than petals, Flowers axillary
19519 Icosandrous glabsous, Leaves linear semiterete obtuse mucronate, Bracts obovate equal to calyx, Tails a little

\section*{and Miscellancous Particulars.}
petals. The leaves are sometimes of a prodigious size, 5 to 7 fer in diameter, and 20 feet or more in circumference, turned up at the rim all round; the under side is purple, with very strong ribs and veins radiating from the petiole till they disappear at the edge. The flowers are of the same gigantic dimensions, and measure more than 1 foot in diameter ; they are very fragrant, and expand in the evening about 6 o'clock; they are at first white, but as they decay towards morning they become red or pink. The plant produces seed in this country, and therefore is likely to pecome plentiful. It requires a strong heat to make it grow freely, and is generally grown by itself in a house called a Victoria honse, or aquarium.
3065. Frezièra theoìdes much resembles Thèa Bohèa both in leaves and flowers. Dr. Macfadyen states that he leaves are astringent, like those of green tea. The shrub is cultivated and propagated like an ordinary stove olant.
3066. Friesin pedunculita is an evergreen half-hardy shrub with deep green leathery leaves. It will probably jecome a pretty conservatory plant. The flowers are something like those of Andromeda speciosa. The culture is he same as that for the species of Elacocarpus. Plenty of water will be required when the plant is in a growing tate.
3067. Saurafja is a genus of fine plants with laurel-like leaves and rather large white flowers. The species will hrive in a mixture of loam, peat, and sand, and ripened cuttings will strike root unfler a hand-glass in the isual way.

History, Use, Propagation, Culture,
3071. Smeathmánnia. The species are pretty shrubs with tea-like leaves and pretty white flowers. S. larigata grows on the hills at Sierra Leone, and is one of the most showy plants there; it flowers so profusely. S. pubéscens grows in the lowlands by the sides of rivulets in thickets, and is not so showy a plant as S. lavigata. A mixture of loam, peat, and sand will suit them, and cuttings will strike root in the usual way. They require plenty of heat and moisture when growing.
19552. Illicium religiòsum is the celebrated Anise tree. There seem to be two kinds of Anise tree: the \(I\). anisidtum of Loureiro, the Chinese kind; and I. religiosum Sieboldt, the I. anisatum of Thunberg, the Japanese kind. By the Japanese this plant is held sacred. They strew wreaths of it and branches over the tombs of their friends; and their priests burn the bark as a perfume upon the altars of their deities. A singular use is made of the pulverised

\section*{PENTAGYNIA.}

19542 Spurs thick curved much shorter than the lip, Pistils exceeding the stamens a little, Fruit ovoid umbilicate at base
19543 Glabrous, Spurs straight and very long at least 5 times longer than the limb, Stamens much exserted exceeding the 3-5 styles
19544 Stem many-flowered downy tomentose under the calyx, Lis pil. beneath, Leaflets cuneated 3 lobed, Segments truncate cut, Flowers pilose, Sepals acuminated twisted round the spurs, Ovaries glabrous
19545 Radical Leaves biternate glaucous beneath, Leaflets cuneate lobed, Spurs very long straight slender twice as long as limb, Sepals rhomboid-Ianceolate
19546 Downy subglandular many-flowered, Segments of lower Leaves divided beyond the middle, Flowers large, Sepals ovate-lanceolate acute, Spurs hooked much shorter than the truncate lamina
19547 Glaucous downy many-flowered, Leaves tritid cuneated, Segments 2-3-lobed, upper ones ovate entire, Flowers large pilose, Sepals ovate-lanc., Spurs reddish straight shorter than truncate lamioa, Ovaries glandul. villous
19548 Stem Petioles and Peduncles beset with glandular down, Spurs deep blue straight equal in length to caly \(x\), Limb of Petals obovate, Stamens and Style shorter than petals, Fruit pilose

19549 Branches rather silky, Leaves oblong coarsely serrated acuminated tapering into the petioles giabrous shining, Urceolus cut pilose inside.
[Leaves oblong serrateiy toothed obtuse at hase, Urceolus bearded
19550 Younger branches and Petioles glandular, Ribs beneath calyxes and peduncles covered with rusty hairs,

History, Use, Propagation, Culture,
19572. Clématis indivìsa and its variety lobàta quite festoon the trees in New Zealand with their dense foliage and large panicles of white flowers.
1956. Ranunculus cortu afolius is the handsomest of all the buttercups. The roots are grumose. The flowers are large and yellow. The plant requires protection in winter.
3073. Cathcirtia. This is a pretty biennial plant, and will grow in any light rich soil ; but in a sheltered situation.
[and alabastra, Peduncles and younger stems woolly, Sepals 6 ovate acuminated spreading 19563 Lvs simple and ternate, Leaflets coriaceous cordate acuminate villous beneath and on the branches petioles 19564 Peduncles 1-flowered stalked within the involucrum, Leaves ovate somewhat cordate toothed in fascicles
[obovate tomentose, Tails of Carpels villous 19565 Herbaceous erect, Leaves pinnate, Leaflets ovate-lanceolate entire 2 - 3 -lobed, Corymbs panicled, Sepals 4-5 19566 Leaves ternate, Leaflets ovate-cordate broady crenate reticulated smooth coriaceous, Flowers panicled diœcious of 6 sepals
[coarse serratures, Fiws small downy, Corymbs axillary and terminal downy panicled 19567 A rambling shrub with habit of C. virginiana, Leaves pinnate, Leaflets ovate slightly cordate acum, with a few 19568 Glabrous slender, Stems angular, Leaves pinnately bi-triternate, Leaflets small tripartite, Segments ovate ent. or deeply ser., Peduncs 1-flwd solit., Seps 4 obl.-obt. recvd at top dwny inside, Carps dwny with feathery tails
19569 Lvs tern. glab., Lits ov.-lanc. acum. ent. 3-nerved at base, Peduncs shorter than lvs, Flws panic. diœcious
[minal and axillary, Sepals linear oblong at first tubular but at length revolute downy outside 19570 Erect rather downy, Leaves trifoliate on long petioles, Leaflets ovate a little lobed mucr. toothed, Corymbs ter 19571 Lvs ovate cordate slightly peltate entire or slightly crenulate glabrous, Panicles axillary Sepals 4 clothed with rusty tomentum
19572 Diœcious, Flowers panicled, Sepals 5-7 elliptic silky, Leaves ternate, Leaflets petiolate ovate entire, adult ones glabrous
\(\beta\) L.eaflets lobed

\section*{19573 Glaucous slender, Leaflets ovate reticulated, Flowers scattered in somewhat horizontal racemes}
[ones palmately multifd with linear segments, Calyx spreading, Fruit oblong
19574 Downy hairy, Lvs subcoriaceous glaucous green, radical ones rundish cordate coarsely serrate crenate, cauline 19575 Root grumose, Leaves rather hairy, radical ones petiolate orbicular, lower on's 5 -lobed toothed, upper ones tripartite with linear entire lobes, Stem erect few-flowered, Caly \(x\) spreading, Spike of Carpels elongated
19576 Tall pil., Rad. Lvs cordately reniform, lobes lobed and toothed, caul. ones nearly sess. 3-5-parted, floral ones lanc., Stem corymbosely bruchd at top, Sepals villous, Head of Carp. obl. glob., Carp. ending in a hooked style
19577 Floating and creeping, Lvs all cordate roundish subpeltate 3-5-lobed, Lobes with 2. 3 notches, Carpels transversely wrinkled semi-obovate with a terminal acute point, Receptacle not setose
19578 Floating, Submersed Leaves divided into capillary segments, Floating Leaves subpeltate tripartite, Segments triangularly obovate 2 -4-cleft, Carpels subobovate blunt with a subterminal point, Receptacle setose
19579 Submersed, Stems ascending, Leaves all submersed divided into numerous capillary 2-4-times forked segments, Carpels ovate compressed tipped by the long acute curved style
19580 Stems floating, Leaves all submersed 2-3-times forked, Segments elongated setaceous parallel, Carpels obovate inflated with a short straight lateral point
19581 Covered with brown villi, Stem simple, Lower Lvs on long petioles cordate palmately or pedately 5-lobed, lobes lobuled, upper lvs sessile the uppermost ones pinnatifid, Peduncles terminal and axillary, Flowers drooping
19582 Leaves opposite cordate crenated downy beneath, Flowers white pedunculate
19583 Lvs digitately palmate, Segments tripartite, Peduncles very short 1 -fivd, Flowers stellate or spreading, Sepals 9 lanceolate a little cut, Petals linear-cuneate rounded at apex
[coloured dark purple changing to green
19584 Radical Lvs glabrous pedate, cauline nearly sessile pinnate, Stem subangular bifidly branched, Sepals roundish 19585 Lvs pedate, floral ones sessile palmate, Segments lanceolate serrated separable to the base and entire, Peduncles bifid or trifid, Sepals roundish-ovate acute petaloid white suffused with purple
19586 Radical Leaves palmate, Segmeuts oblong-linear serrated entire at base, Stem 2 -flowered, Floral Leaves nearly sessile, Sepals ovate obtuse greenish white
[toothed, Sepals \(8-10\), Stamens and Pistils numerous 19587 Creeping radicant, Leaves broadly sheathing the stem at the base on long petioles ovate-sagittate sinuately [Flowers subumbellate, Sepals 5 oblong-ovate, Stigmas elongated and a little hooked 19588 Stem erect leafy, Leaves large roundish toothed, Auricles large approximate, Floral Leaves deeply serrated,
exserted; the rudiments of the two upper ones small, club-shaped, or wanting. Anthers dimidiate. Style bifid: Lobes subulate.
3076. 1263b. Pogogyne. Calyx campanulate, 13-nerved: Teeth lanceolate; the lower one longest. Corolla bilabiate: Tube straight, exserted, naked inside: Upper lip entire; lower lip trifid. Stamens ascending, approximate at top. Cells of Anthers distinct parallel, mutic. Style villous, bifid at apex.
3077. 1268a. Eremóstachys. Calyx tubular or funnel-shaped, with 5 spinose teeth; or the limb is large membra-

and Miscellaneous Particulars.
It would perhaps be safer to grow them in pots the first year, placing them under shelter in winter like ordınary alpine plants; and in the month of May, in the second year of their growth, planting them out in the open border.
3074. Eucrýshia is a very pretty tree lately introduced. It will grow in a compost of sand, peat, and loam; and young cuttings will strike root if planted in sand and covered with a bell-glass.
19585. Helléborus orientàlis is said to be the true black Hellebore of the ancients.
neous and mucroniform, Corolla with an enclosed tube, and a bilabiate gaping limb: Upper lip elongated, galeate, pilose outside, bearded inside and on the margins; lower lip spreading, tritid. Two upper Fslaments thickened intoa blunt or fringed appendage at base. Anthers approximate by pairs. Style bifid. Achenia dry, hairy.
3078. \(1268 \%\). Colquhocinia. Calyx turbinately campanulate, 10 -nerved, 5 -toothed, with a niked throat. Corolla with a curved tube, naked inside, a dilated throat, and a bilabiate limb: Upper lip erect, entire; lower lip of three short entire lobes. Stamens ascending under the helmet. Style bifid. Achenia oblong, smooth, drawn out into a membrane at top.
3179. 1271a. Bècium. Calyx bilabiate: Upper lip decurrent, dilated; lower lip truncate, ciliated. Corolla bilabiate: Upper lip 3-lobed, the middle segment cleft; lower lip cblong, concave. Stamens very long. Ovariun inmersed in a 4 -toonthed disk. Stigma 2-lobed.
30s0. 127צra. Cedronélla. Calyx tubular or campanulate, 15 -nerved, with a nearly equal or obliquely 5 -toothed Jimb. Corolla with an exserted tube, naked inside, a dilated throat, and a bilabiate limb: Upper lip straight, flattish, emarginately bifid; lower one trifid, with a large middle lobe. Stamens ascending. Style bifid. Achenia dry, smooth.
3081. 1284a. Hemiándrc. Calyx campanulate striated: Lips flat, closed over the fruit; upper lip entire; lower lip bitid. Corolla with a short wide tube, a campanulate throat, and a bilabiate limb: Upper lip bifid; the lower one 3-lobed, the midile lobe emarginate. Stamens glabrous. Anthers dimidiate: Fertile cell ascending; sterile cell descending. Style bifid at apex
3082. 128 1 b. Monardella. Calyx ovate, tubular, 10-13-nerved, 5-toothed: Throat naked. Corolla subbilabiate: Upper lip bifid; lower trifid. Staimens nearly equal, diverging, exserted. Cells of Anthers parallel, at length divari. cate. Style bifid at apex. Stigmas minute. Achenia dry.

\section*{Order II. ANGIOSPERMIA. Seeds several, enclosed in an undivided pericarpium.}
3083. 1291a. Chrysbthemis. Calyx campanulate, 5 -toothed, with 5 projecting sides. Corolla almost regular, with 2 projecting folds on the lower lip. Stamens enclosed. Stigmas 2-lobed. Perigynous disk a notched fleshy gland. 3084. 1291b. Collindra. Calyx free, 5 -parted. Corolla tubular, compressed, angular, rather ventricose, inflated at base, curved: Segments 5 , equal, erectly incurved. Flowers sessile, aggregate, bracteate, turned downwards. Bracts and Sepals lanceolate, acuminate, jagged.
3085. 1291c. Allopléctus. Calyx 5-cleft, coloured: Segments imbricate. Corolla tubular or club-shaped: Limb 5 -lobed or 5 -toothed. Stamens with small rudiment of a fitth at base of tube. Hypogynous ring swollen into a gland behind. Capsule baccate, ovate, coriaceous, 1-celled, 2 -valved, many-seeded. Seeds oblong.
3086. 1291d. Macróchlamys. Calyx regular, surrounded by petaloid bracts; the rest as in Allopléctus.
3087. 1291e. Hypocirta. Calyx 5-parted. Corolla tubular, gibbous behind at base: Tube ventricose in front: Limb 5-lobed or 5 -toothed, nearly equal. Stamens with the rudinent of a fifth behind. Anthers cohering by pairs. Ovarium with a hypogynous cup-shaped disk. Berry globose, coloured, juicy, l-celled. Seeds many, fixed to two 2-lobed parietal placentas.
3088. \(1291 f\). Episcia. Calyx 5-parted or 5 -cleft. Corolla funnel-shaped, gibbous behind at base, 5 -lobed. Stamens with the rulinent of a fifth behind. Hypogynous disk swelling into a gland behind. Capsule nearly globose, membranous, 2 -valved, with two bilamellate parietal placentas. Seeds numerous oblong.
3089. 129 g . Drymomia. Calyx obliquely 5 -leaved, 2 interior. Corolla obliquely campanulate, subringent, gibbous at base: Upper lip 2-lobed; lower lip 3-lobed. Hypogynous disk bearing an ovate gland behind. Capsule baccate, ovate, coriareous, 1-celled, 2-valved, with two parietal bilamellate placentas. Seeds numerous fusiform.
3050. 1291h. Nematánthus. Calyx 5-parted, oblique. Corolla campanulately funnel-shaped, oblique, gibbous at base behind, with an open throat and equal 5 -lobed limb. Hypogynous ring swollen into an oblong gland behind. Capsule pyramidal, coriaceous, 1-celled, 2-valved. Placentas 2, parietal, bilamellate. Seeds numerous, oblong.

30!1. 129li. Campània. Calyx of 5 oval, acuminated, 3-nerved divisions. Corolla large, campanulate, hairy: Limb of 5 rounded lobes. Stamens enclosed, glabrous. Anthers heart-shaped, firmly joined together. Disk formed of 5 yellow, fleshy, obtuse glands, surrounding the hairy ovarium.
3092. 1291j. Conradia. Calyx adnate to the ovarium, 5 -cleft or 5 -toothed. Corolla tubular or campanulate, 5 cleft. Stamens with the rudiment of a fifth behind. Anthers usually cohering. Glands on disk wanting. Capsule dry, covered by the \(5-10\)-ribbed calyx, flat at top, 2 -valved. Placentas 2, parietal. Seed scobiform.

3093 . 1291k. Mitraria. Calyx 5-parted, equal, calyculated by a 2 -lobed mitre-shaped bract. Corolla tubularly ventricose: Upper lip 2-lobed; lower 3-lobed. Sramens exserted, with the rudiment of a fifth behind. Berry 1cellud, many-seeded.
3094. 1291l. Arctócalyx. Calyx tubularly campanulate, shaggy, smooth in its upper part. Corolla with a lacerated or fringed, 5 -lobed, nearly equal limb, and a curved tube, broadest upwards.
3095. 1241 m . Centrosolenia. Calyx 5 -parted: Segments serrated. Corolla tubular, spurred behind at base; the throat widened; and the limb short, \(5 \cdot l\) lubed, and spreading. Stamens enclosed, with a minute rudiment of a fifth abortive filament. Hypogynous ring obscure; the hind glund large. Ovarium hairy. Style dilated at apex, subcapitate. Fruit cansular.
3096. 1291n. Heintzia. Calyx large, 5-parted. Corolla funnel-shaped: Tube curved: Limb of 5 spreading hairy segments.
3097. 12910. Moussdnia. Calyx 5-parted. Corolla \(\frac{1}{8}\) an inch long, curved, swollen about the middle of tube: Limb of 5 spreading, nearly equal, erosely crenated segments.
3098. 1292a, Abelia. Calyx oblong: Limb 2-5-parted: Segments oblong, foliaceous. Corolla tubular, funnelshaped, 5 -lobed, nearly equal. Stigma capitate. Ovarium 3 -celled; 2 of the cells contain many ovula, but they all become abortive; but the third cell contains only lovulum, which comes to perfection. Fruit l-seeded, indehiscent, crowned by the foliaceous limb of the calyx.
3099. 1294g. Spathodia. Calyx spathaceous, cleft on one side, and toothed or entire on the other. Corolla funnelshaped, with a 5 -lobed, rather unequal, subbilabiate limb. Stamens with the addition of a fifth or sterile filament. Cells of Anthers divaricate, Stigma bilamellate. Capsule silique-formed, falcate, falsely 4-celled. Seeds transverse, with membranous wings.
3100. 1294h. Adenocalymma. Calyx campanulate, 3-toothed, rarely truncate, and rarely spathaceously cleft; bearing 10 large, Aattish, brown glands near the top. Corolla tubular, with a nearly equal 4-lobed limb. Stamens 4 fertile, and I sterile. Lobes of Anthers divaricate, glabrous. Stigma bilamellate.
3101. 1294i. Colea. Calyx campanulate, 5-toothed. Corolla funnel-shaped, with a long tube a little widened at top; and a 5 -parted spreading limb, having the lobes equal. Style filiform. Stigma bilamellate. Fruit fleshy, oblong, 2-celled, tipped by the style.
3102. 1295a. Phyllárthron. Calyx campanulate, 5-toothed. Corolla funnel-shaped, 5-lobed: Lobes roundish. Stamens enclosed. Cells of Anthers spreading. Ovarium inserted in a fleshy disk. Fruit silique-formed, indehiscent. Seeds not winged.
3103. 1297a. Tetranèma. Calyx 5-parted. Corolla bilabiate: Upper lip flat, emarginate; lower lip longer, trifid. Stamens declinate, shorter than the corolla. Cells of Anthers divaricate. Stigma subcapitate. Capsule 2 valved: Valves entire, septiferous in the middle. Seeds numerous, angular.
3104. 1301a. Dilivaria. Calyx 4-parted. Upper and lower segments a little larger, entire, callous at base. Corolla unilabiate: Lip 3-lobed: Palate convex, thickened, the upper edges entire. Anthers 1-celled, with bearded ciliated margias. Filaments straight. Capsule 2 -celled, compressed, 4 -seeded from base to middle. Seeds cordate. ovate, compressed, tubercled. Retinacula thick, obtuse.
3105. 1302a. Asteracántha. Calyx 4-parced to base: lower segment bidentate. Corolla deeply bilabiate: Upper lip bifid; lower trifid, bicallous at the origin of the segments. Stamens connate by pairs at base. Anthers 2-celled, glabrous. Stigma simple, acuminate. Capsule 2-celled, compressed, 8 -seeded. Seeds ovate, compressed, truncate at base, smooth, propped by small retinacula.
3106. 1304 d. Stemonacanthus. Calyx 5-parted, equal. Corolla funnel-shaped. Limb spreading, reflexed.

Stamens prominent. Cells of Anthers whith a broad connective and membranous edge. Stigma bilabiate. Capsule contract d and seedless at base, and indlated and ovate or oblong at top, and 4-8-seeded. Stigma bilabiate. Capsule dentate retinacula.
3107. 1304e. Sericógraphis. Calyx 5-parted, equal. Bracts and bracteoles usually subulate Corla Tube short, furnished inside with 3 silky shining bodies, or deficient stamens: usually subulate. Corolla ringent : at apex and 4 -seeded. Seeds muricated the tube. Stigma bifid. Capsule depressed at base and seedless, compreser at apex and 4 -seeded. Seeds muricated, propped by retinacula. which are bifid at apex. 3108. 1304f. Salpixintha. Calyx small, 5 -toothed, bibracteate. Which are bifid at apex.

5-lobed: Lobes retuse. Stamens equal, inserted in the narrow part of the fube. Ovarium : Limbregular, spreading, disk. Cells biovulate. Style siender. Stigma obtuse. 3109. 1304g. Strobilórachis. Calyx short, 5 -parted
long, narrow, recurved tube, and a broad campanalate limb: Segments large: Upper lip 2-lobed: bilabiate, with a with ovate, roundish segments. Anthers 1-celled, acute at base. Segments large: Upper lip 2-lobed; lower lip trifid, Capsule 4-seeded.
. Stigma funnel-shaped, 2-lobed.
nerved. Corolla campanulate, funnel-shaped: Tube with 5 eleft. Bracts usually coloured, opposite, obovate, 3sterile stamen rudimentary. Ovarium compressed. Hypogynous disk lia: Limb blabiate, spreading. Fifth or Stigma small, capitate. 3:11. 1304i. Petalidium. Calyx equal, 5 -parted, enclosed by 2 valvate bracts. Corolla funnel-shaped: Limb nearly equal. Stamens enclosed. Anthers oblong, sagittate. Cells parallel, awned at base. Stigma bifid. Capsule 3112. 1304k. Dipteracánthus. Calyx equal, 5 .

Stamens enclosed. Anthers linear-sagittate: Cells parallel, equal, mutic. Stipma wila nearly equal 5 -cleft limb. Capsule compressed at base, seedless, large and \(2-8-12-16\)-seeded at topic. Stigma bilamellate, nodulose at base. tumid margin. Retinacula uncinate, præmorse.
3113. 1304l. Asystasia. Calyx 5-parted rather concave. Cells of Anthers parallel, villous, or appendiculate shaped, 5 -cleft, nearly equal ; the hind segment 4-seeded. Seeds discoid. Anthers parallel, villous, or appendiculate at base. Capsule stipitate, tetragonal, 2-celled, 3114. 1304 m . Hydrom

Corolla funmel-shaped, bilabiate: Uppibracteate, 5 -parted: upper segments equal, acute; the fifth or hind one obtuse. equal, bearded. Anthers 1-celled, bearded at base and revolute lobes; lower lip trifid, with equal lobes. Stamens Cells 2 -seeded. Speds discoid, furnished with hooked retinacula. 315 bilabiate. Capsule sessike, tetragonal, 2 -celled: 3115. 1318a. Hexacéutris. Calyx small, saucer-shaped rula. Corolla campanulately funnel-shaped: Tube short : Limb nearly equal, obliquely 5 -cleft. Stape 2 , covering the calyx. throat into a bearded ring. Anthers 2-celled: Cells parallel, one of the upper sty 5 -cleft. Stamens inserted in the base, and the other a short mucrone. Lower stamens with long flexuous spurs. Stainens furnished with a long spur at 4-speded, rostrate : Seeds crested. Lower stamens with long flexuous spurs. Stigma biturcate. Capsule 2 -celled,
\(3116.1308 b\). Meyenia. Calyx
widened: 'Tube short, closed by a pilose ring, enclosed in 2 large bracts. Corolla funnel-shaped: Throat gradually upper ones unequal, tomentose ; of the lower ones parallel equal. Anthers bearded at top, 2-celled; Cells of dilated 2-lipped: Lips 2-lobed. Capsule 2-celled at base, conico-attenuated, 4-seeded. Stigma membranaceously shaped spongy strophiola.
3117. 1314a. Mastacánthus. Calyx 5-cleft: Segments equal, counit ringent, 5 -cleft : Segments of the upper lip 4 , ovate, erect, nearly equal ; lower lip of oning state. Corolla simple. 3118. 1314b. Sclerdon. Calyx campanulate, 4-toothed. Corolla funnel-shaped, 4-cleft, Ovarium 4-celled Cells l-ovulate. Style short. Stigmas distinct, obtuse, Drupe indehiscent, covered by the unchanged 4-celled : Cells bony, Cells 4 ; of these 2 are abortive, 1-seeded. Seeds oblong, fixed at the side. by the unchanged calyx. Putamen lobed limb. Stamens ia. Calyx tubular, 5-cleft or 5-toothed. Corolla tubular,
3120 . 1331 . Ptamens enclosed. Ovarium 2 -celled, few-ovulate. Stigma capitate, undivided, with an irregular 5with the rudiment of afiscus. Calyx 5 -parted. Corolla funnel-shaped, 5 -lobed: Lobes nearly. Fruit a berry. with the rudiment of a fith. Style fliform. Stigma bilabiate: Lower lip recurved. Fruity equal. Stamens woolly, solitary, pendulte compressed, having the margius broadly 2 -winged, and subtubercular in coriaceous, capsular, in 3121 , pendulous, proiuced above.
usually gibbous at base, with a tat 5-lobed : Limb 5-parted: Lobes lanceolate. Corolla tubularly funnel-shaped, Nectary glandular, annular. Style ending inab: Lobes nearly equal, roundish. Rudiment of fith stamen presen centas parallel, sessile
cely thickened stigma. Capsule semibilocular, 2-valved. Pla-
Stamens enchosed, nearly equal, with a fith scorile rotate, 5-cleft : 2 upper segments smallest and more combined.
seeded. Stigma simple. equal, Perigynous glands wanting. Ovarium l-celled, many-
3123. 1362c. Diast

With the rudiment of a fifth. Palyx 5 -parted. Corolla with a declinate tube and a 5wcleft limb. Stamens enclosed, Valves of Capsule placentiferous. Perigynous glands 5. Style bilamellate: Lobes membranous, stigmatose inside, 3124. 1362d. Chirita. Calyx 5 -cleft valverous

Cells of anthers diverging. Upper lip of Stigma abortive or very small ; lubular, bilabiate. Stamens 2, antheriferous. 3125 . 1362 e. Didy Seed inappendiculate, pendulous.
3125. 1362e. Didymocárpus. Calyx 5-cle't. Corolla funnel-shap limb : Upper lip the shortest. Stamens 4, enclosed, 2 of which bel-shaped, with a ventricose throat and a 5 -lobed with transverse cells. Stigma lateral, flattish, obtuse. Capsur anthers; sterile ones very short. Anthers adnate, baked, pendulous. Lobes of Dissepiment revolute. In. Kligea. Calyx tubular, unequal
little 3 -lobed. Stosed throat, and a bilabiate limb: Upper lous above, 5 angled, 5 -winged, 5 -cleft. Corolla with a little 3-lohed. Stamens enclosed. Anthers reniform, 2-celled, cohering O-lobed, lower lipdrawn tut, undivided, or a \(3127.136 \%\), with 2 parietal many-seeded placentas. Seeds elliptic oblong, ovarium 1-celled, girded by a complete panulate throat and an obliques. Calyx ventricosely tubular, 5 -cleft. Corolla tubular incurved transversely. at first conniving by pairs, with parallel cells. Stigma Stamens exserted, usually with the rudiment of a fifth. Anthers valved, falsely 4-celled. Seeds small, usuall, Stigma somewhat funnel-shaped. Capsule long, siligue. Anthers 312\%. 1362h. Agalmyla. Calyx 5-parted papillose, ending in a bristle at each end. subbilabiate limb. Stamens 5 , exserted, of which \(2-4\) are fertile. Anthers linear, connected with and a 5 -lobed
Stigma bilamellate. Capsule long, silique-formed, 2 , 2 , end.
a-celled. Seeds minute, ending in a hair at each spreading. Stamens 7. Anthers uniform, equal to the throat or exserted-shaped or salver-shaped, 5-parted: Limb Valves rather bifid,

Capsule glabrous, septicidally 2-valved : limb. Stigma subtruncate. Capsule woody, 2-celled, 2-valved: Valves septicidal. Seeds numerous, each surrounded
by a wing. 3131 .
emarginate; lower nne 3-lobed. Stamens enclosed. Anthers approximate by pact. Corolla ringent: Upper lip Stigma eutire, dilated. Capsule oblong, bisulcate, 2-valved. Dissepiment duplicate. Seeds small separate, stipitate,

History, Use, Propagation, Culture,
3075. Audibértia. The species of this genus have the habit of sage, with rather a disagreeable odour. Their culture is easy, and they are readily propagated by cuttings.
3076. Pogogyne multifiora. The seed of this plant may be sown in a pot, and the plants afterwards planted out in the open ground.
3077. Eremostachys laciniata is an inhabitant of the Eastern part of the Caucasus on dry hills. It is diffecult to

\section*{GYMNOSPERMIA.}

19589 Suffruticose, Lvs oblong obtuse entire or 3-lobed downy, Limb of Corolla 5-lobed secund, Flowers solitary axillary yellow variegated with red

19590 Lvs linear 3 in a whorl with revolute edges cinereous beneath, Calyx downy silky having the teeth longer than tube
19591 Lvs 3 in a whorl linear with revolute edges green on both surfaces, Teeth of Calyx length of tube
19592 Lvs 3 in a whorl linear-lanceolate divaricate mucronate pungent with revolute edges cinereous on both surfaces as is the calyx, Teeth of Calyx very short
19593 Erect glabrous, Lvs ovate-roundish subcordate at base crenated green, Racemes loose few-fiowered, Corolla with a very slender much exserted tube
19594 Downy, Lvs 4 in a whorl elliptic-linear entire or serrated, Floral leaves linear shorter than whorls, Spikes elongated
19595 Downy at top, Stem creeping, Branches erect, Leaves 6-8 in a whorl narrow linear entire, Floral leaves subulate, Flowers spicate, Calyx villous
19596 Lvs orbicular, cauline ones petiolate, floral ones stem-clasping, all deeply crenate, Teeth of Calyx subulate longer than tube, Galea oblong entire
[Calyx hispid with spinescent teeth, Lower lip of Corolla large
19597 Procumbent pilose, Livs ovate obtuse crenated rounded or subcordate at base, Whorls 2-4-fiowered remote, \(\beta\) Flowers white

19598 Plant snow-white, Lvs oblong blunt crenated, Racemes one-sided, Stamens exserted
19599 Suffruticose branched canescent, Lvs obovate obtuse entire, foral ones broad ovate, Racemes simple, Stamens exserted

19600 Floral leaves and bracts shorter than corollas, Stamens exserted
[6-flowered, Bracts subulate
19601 Clothed with floccose wool, Radical leaves cordate oblong obtuse crenated, cauline leaves lanceolate, Whorls 19602 Stm simp. or brachd a little hisp., Lvs downy, lower ones hastately cord., up. flor. Ivs shorter than cals, Brets subul. downy cil. like cal., Whorls about 10 -fwd
[Brets lin. cil., Cal. cil., Galea of Cor. pil.
19603 Stem nrly simp. obversely pil., Low. Ivs broad ov. obt. cren. cord. at base wrinkled green vil., floral Ivs obl.,
19604 Erect tomentose, Lvs ovate-lanceolate obtuse crenated downy above tomentose beneath, Bracts subulate ciliated, Calyx floccose with stiff subulate teeth
19605 Lvs pinnate, Segments oblong-lanceolate or linear deeply pinnatifid, Calyx large tubularly campanulate scarcely dilated at apex
[red in whorls 19606 Scandent, Leaves glabrous, the younger ones and calyxes canescent, Teeth of Calyx ovate obtuse, Flowers
[lary solitary 1-flowered, Corolla 2 inches long
19607 Hairy woody at base, beset with viscid glands, Leaves petiolate ovate acute coarsely serrated, Peduncles axil19608 Root partly creeping, Stems loose, Branches elongated, Leaves ovate, upper ones acute serrate, Cymes manyflowered stalked

19609 Suffruticose diffuse nearly glabrous, Leaves roundish or ovate petiolate entire, Whorls 4-6-flowered, Flowers almost sessile, Corolla twice as long as calyx

19610 Leaves broad-ovate acute serrated, Branches downy tetragonal, Verticels approximate racemose, Filaments a little exserted entire naked, Corolla scarcely longer than calyx

19611 Downy, Leaves ovate-lanceolate serrated, Whorls of Flowers spicate, Bracts cordate, Corolla white veined with lilac

> and Miscellaneous Particulars.
cultivate on account of the large fleshy roots suffering in winter from excess of moisture. It therefore should be planted in a dry situation. It is only to be propagated by seed.
3078. Colquhounia coccinea has succeeded in the open air against the south wall for two or three winters. It is a plant of easy culture and readily increased by cuttings.
3079. Bécium should be cultivated and treated like the greenhouse species of Teucrium.

History，Use，Propagation，Culture，
3080．Cedronélla càna．The leaves of this plant，and of C．mexicàna and C．pállida，abound in fragrant oil－dots． They are handsome border plants，and will grow in any common garden soil；and are increased by division or by cuttings taken from the lower part of the stems．
30181．Hemiándra is composed of shrubs nearly related to Westringia；and the culture and propagation are the sanie．Turfy peat and leaf－mould with loam is said to be the best for them．

19628．Scutellivia japónica is a small evergreen trailing shrubby plant，well fitted for decorating rock work．It is a pretty little plant with blue spotted flowers．

19612 Stoloniferous downy, Leaves cordate-ovate crenated, Whorls few-flowered secund approximating into spikes or racemes
19613 Erect, Leaves ovate.cordate acuminated coarsely crenated almost glabrous purplish beneath, Cymes pedunculate in terminal racemes, Flowers crowded
19614 Erect, Leaves all cordate-ovate obtuse crenated downy beneath, Whorls naked spicate, Calyx tubular
19615 Erect, Lvs cord., lower ones hast.-ov. ent. or toothed hoary, Spikes long many-fiwd, Whorls approx., Cal. tub. 19616 Shrubby, Leaves ternate, Leaflets oblong-lanceolate, Whorls collected into terete oblong spikes

19617 Downy, Leaves ovate acuminated on long petioles, floral ones deciduous, Racemes panicled, Whorls cymose, Fruit-bearing Calyx nutant
19618 Glabr. or nearly so, Lvs ovate-oblong narrowed at base glandular on both sides toothed or cut, Racs few-flwd 19619 Branchlets downy, Leaves linear glabrous glandular beneath denticulated above, Calyx pilose ciliated 19620 Glabrous, Leaves linear entire, Racemes terminal, Calyx ciliated
19621 Leaves roundish crenated downy, Racemes dense few-flowered, Calyx downy with entire lips
19622 Leaves orbicular crenated glabrous glandular on both surfaces, Flowers axillary, Lower lip of Calyx retuse
19623 Leaves rhomb-orbicular entire glandular beneath shining above, Branches and Calyxes downy, Flowers axillary
[lip of Calyx acuminate prickly, lower one shorter inflexed often recurved 19624 Glabrous or with a few spreading hairs, Leaves linear spreading, Peduncles much shorter than calyx, Upper 19625 Erect downy, Leaves linear-oblong complicate pungent 3 -nerved, Calyxes nearly sessile villous with pungent segments, Upper lip of Corolla rounded emarginate
19626 Procumbent at base ascending at top, Leaves oblong-linear obtuse undulated glabrous, Outer Bracts broadovate, Caly x villous tubular
19627 Ascending smoothish, Lvs sessile lanceolate obtuse entire ciliated, Floral Leaves longer than calyx, Racemes simple, Flowers opposite secund, Calyx pilose, Corolla downy outside
rrolla elongated
19628 Small evergreen trailing, Stems quadrangul., Lvs petiol. somewhat spoon-shaped serrated obt., Racs term., Co-
19629 Erect, Lvs ov. coarsely serr. acum. downy ben., Racs term., Cor, elong. dilated above, upper lip hardly cleft
19630 Erect downy glandular, Leaves cordate-ovate bluatish coarsely serrated on long petioles, Racemes terminal subsecund, Corolla elongated, upper lip bifid
19631 Erect hairy glandular, Leaves roundish-cordate wrinkled acute on long petioles coarsely toothed, Flowers subverticillate glandularly hairy, Corolla elongated

19632 This differs but little from P. vulgaris, and is only, probably, a variety of

\section*{ANGIOSPERMIA.}
[with a long tube, upper lip straight 2-lobed 19633 Leaves whorled cordate-oblong toothed downy, Panicle subverticillate, Pedicels long umbellate hairy, Corolla 19634 Leaves opposite on long petioles cordate-ovate concave tomentose rugose, Racemes simple, Pedicels elongated, Tube of Corolla long inflated beneath, limb 5-lobed, Hypogynous glands 2
19635 Leaves large opposite petiolate cordate-ovate crenated downy, Panicle branched glabrous, Pedicels elongated, slender aggregate, Flowers pendulous, Corolla glabrous clavately cylindrical, Hypogynous glands 2
9636 Stem a horizontal rhizoma, Lvs broad-ov. toothed cord. at base downy, Peduncs from base of rhizoma
[lobes long wavy, limb nearly equal, Root a round tuber I to \(1 \frac{1}{8}\) inch in diameter 19637 Tubers scaly, Leaves opposite bluntly serrated, Peduncles elongated drooping, Corolla large tubular erect, lower 19638 Tubers scaly, Lvs opp. cordate serrated petiolate, Racemes ample terminal, Flowers on long peduncs drooping, Cor. scarlet above yellow below
[Cor, villous cylind. gland., limb 5 -lobed, Hypog. glands 4-5 19639 Hairy, Lvs opposite or 3 in a whorl pet. ovate or obov. acute serr., Racs term., Peduncs 1-flwd fascicd whorled, 9640 Downy, Leaves opposite petiolate lanceolate serrated, Racemes terminal, Pedicels whorled fascicled, Corolla villous cylindric ventricose, limb of 5 linear lobes
19641 Villous, Leaves 3 in a whorl oblong narrowed at base canescent, Peduncles short axillary 3-flowered, Pedicels elongated, Lobes of Calyx subulate, Corolla cylindrical contracted at base, lobes rounded equal
19642 Duwny, Leaves 3 in a whorl, lower ones opposite elliptic-ovate obtuse crenated sessile, Panicle loose, Corolla elongated curved hairy, upper lip long bitid, Hypogynous glands 5 combined
B Leaves opposite lanceolate-ovate unequal at base on long petioles serrated downy, Peduncles 4-flowered umbellate, Corolla villous tubular rather coustricted at throat

and Miscellaneous Particulars.
1290. Gésnera. M. Decaisne has proposed to divide this genus into several, applying the name Corythroldma to G. striàta, scéptrum, ignea, Márchit, de.: Isoloma to G. vestìa, spicàta, nóllis, longifolia, breviflòra. \&ic. : Dircæ’a to G. brtloдsa, faucialis, laterília, \&c. : Houttea to G. pavdina and Gárdnerí; Tyda'a to G. pícta; Rechsteìnera to G. allophýlız, \&c. ; and the true Gésnera. he limits to G. tuberòsa, cocilcàris, macrostàchya, discolor, polyántha, purpurca, and the like. Perhnps these alterations maybe the means of restoring order among the confused mass of plants referred to the genus Gésnera.
3082. Monardélla will giow well in the open peat border, and is increased by division.

History, Use, Propagation, Culture,
19648. Gésnera breviflòra, if treated like Achimènes, may be had in flower nearly all the year
3083. Chrysothemis is a genus separated from Besleria by Decaisne. It consists of two known species, both of which have an orange-yellow corolla streaked with carmine, enclosed in a calyx of 5 wing-like sinuses. The culture of the pecies is the same as that for Besleria or Gloxinia They grow best in loose peat soil or decayed vegetable mould. C. auruntiaca is a showy fleshy plant, having a cinnabar-coloured calyx and purplish pedicels. The corolla is yellow, with lines and dots of carmine on the face; velvety outside, and smooth inside.

19643 Downy, suffruticose, Leaves 3-4 in a whorl on short petioles oblong-lanc. wrinkled crenated tomentose ben., Peduncs axil. aggregate 1-3-Awd, Cor. villous camp. fun.-shaped, ventric. below, limb short, Hypog. glands 5 19644 Brnchs tetragonal, Lvs opposite ovate serrated wrinkled on short petis hairy, Peduncs solitary twin or tern, 1flwd, Corolla hairy tubular ventricose, limb equal spreading, Hypogynous glands 5

9674 Erect rather woody, Branches tetragonal, Leaves ovate oblong acuminate denticulated pilose above downy beneath, Pedicels axillary 1 -flowered, Lobes of Calyx ovate acuminate, denticulated, Corolla pilose

and Miscellancous Particulars.
3084. Collándra is a genus separated from Gésnera by Lemaire, and'consists at present of several known species, hich are all readily distinguished by the mequailty of each pair of leaves, one of which is always much smaller than ie other, like those of Goldfussia anisophýlla. Most of the species have also, at the points of the leaves, a large bloodloured spot, for which reason they are called Yerba de la Doncella. Their culture is the same as that recommended r Gésnera.
3085. Allopléctus. The species grow best on loose peat soil or decayed vegetable mould.

History，Use，Propagation，Culture，
3086．Macróchlamys includes the species of Allopléctus with coriaceous glabrous leaves，and the calyx surrounded by petaloid bracts，hence the name．Their culture is the same as that for Allopléctus．
3087．Hypocýra grácilis has the leaves spotted with red beneath，and its culture is the same as that for epiphytal Orchidea．It may be allowed to grow over an elevated substance，covered with sods，kept moist or in baskets．

3088．Epáscia．＇The culture and treatment recommended for Drymonia will answer for this plant．
3＇89．Drymonia punctata has the limb of its corolla dotted with purple．The plant does well cultivated in a wire basket，filled with pieces of wood and turf，suspended from a beam in a moist stove．The other species may be treated in the same manner．
3090．Nematänthus ionèma has red drooping flowers．It may he either grown in a pot of turfy peat soil，or in a basket suspended from the rafters，as many epiphytal tropical Orchidece are．

3091．Campania grandifiora．A beautiful herbaceous plant，requiring to be grown in a temperate stove．The stem is scandent，wondy at the base．The leaves are opposite，oval，stalked，hairy，unequal at base，taper－pointed，and crenate－toothed．The flowers are axillary，on long peduncles at sides of shoots，terminal few on long peduncles， large，showy，nodding，irregularly campanulate；the tube curved and ventricose beneath；the border or limb oblique， with 5 broad，nearly equal，emarginate，spreading lobes，white，downy outside，elegantly marked with close dotted lines of rosy purple．

19675 Scandent fleshy, Leaves petiolate ovate-oblong acuminate nearly entire, Peduncles axillary few-flowered, bearing ample roundish obovate subciliated coloured bracts, Corolla downy outside

19676 Ascending radicant, Leaves ovate acute denticulated, Peduncles axillary solitary or twin, Corolla campanulate 19677 Stem erect villous above, Lvs obl.-acum. mucron. strigillose, Flws axil. solitary, Cor. much swollen in front, limb contracted 5-toothed [gate, Cor, tubular villous contracted at the mouth 19678 Erect downy, Stem bluntly tetragonal, Lvs opposite oblong-lanceolate wrinkled serrated, Pedicels axil. aggre-
[slender, Seps lin.-lanc, recur., Cor. purp. with oblique white mouth a nearly equal 5 -lbd limb and rnded lbs 19679 Dwarf hairy decumbent, Lus cordate-ovate acute serrated with impressed veins, Peduncs axil. short simple bifid
[late serrated, Limb of Corolla dotted with purple spreading fringed
19680 Leaves oval on long petioles serrated downy, Flowers axillary nearly sessile, Sepals unequal lanceolate spatu19681 Radicant downy, Leaves oval-lanceolate acute at both ends denticulated of a different colour beneath, Flowers axiliary solitary, Sepals cordate foliaceous serrated, Corolla glabrous, Segments serrulated
19682 Radicant downy, Leaves broad coarsely toothed green, Fiowers solitary axillary, Calyx foliaceous, Corolla lacerated pale-green
19683 Pedicels longer than the leaves, Calyx quinquefid divided beyond the middle
19684 Leaves ovate-lanceolate, Calyx violet hairy, Peduncles very long 6-12 inches hairy
19685 Peduncles hardly exceeding the leaves, Segments of Calyx about 3 times shorter than corolla
19686 Climbing or trailing, Leaves ovate-oblong acuminated fleshy, Flowers axillary mostly solitary, Pedicels long slender hairy, Segments of Calyx lanceolate hairy, Corolla large downy outside spotted inside

19687 Hairy, Leaves opposite oval acuminated oblique soft crenated stalked, Flowers in tufts at ends of long axillary and terminal peduncles, Corolla white lined and dotted with crimson

19688 Leaves oblong, Flowers axillary numerous
19689 Leaves large obovate-oblong, Flowers axillary almost hidden among the leaves

19690 Climbing radicant, Leaves small ovate acute serrated, Peduncles long slender axillary solitary l-flowered
[veins beneath, Flws springing from all parts of the stem sessile, Cor. yellow, with lines and dots of crimson 19691 Stem shaggy blackish brown, Leaves fleshy oval unequal at base doubly serrated shaggy with long hairs on the
[crenated, Filaments pilose at top
19692 Leaves nearly equal oval or obovate velvety painted serrated on long petioles, Corolla hairy, lobes obscurely 19693 Leaves opposite of unequal size, the large one oblique oboval-oblong serrated pilose on the ribs beneath, small leaf lanceolate, Corolla downy, lower lobes fringed
19694 Tall, Stem succulent, Lvs nearly equal large ovate acuminate coarsely and unequally serrated perfoliate at base, Peduncles short axillary many-flwd, Flws aggregate bracteate, 2 outer bracts large concave orbicular acuminate, Lobes of Corolla entire
19695 Leaves lanceolate serrate, Cymes axillary with rose-coloured bracts
[on short petioles, Peduncles umbellate 3-4-flowered axillary 19696 Suffruticose soft-stemmed, Plant more or less tinged with red, Leaves ovate-oblong acuminate crenate-toothed

and Misccllaneous Particulars.
3092. Conrddia requires the culture and treatment of Gésnera.
3093. Mitrària coccinea will perhaps succeed in the open air. A compost of leaf mould, loam, and peat is the best oil for it.
3094. Arctócalyz Endlicheriana is a remarkable looking epiphytal shrubby plant, shaggy all over. Stems radicant, eadily propagated by cuttings of the steme calyx, yellow. It requires a cool humid stove or orchideous house, and is 3095 . Propagated by cutt ings of the stem.
3095. Centrosolènia picta has the leaves blotched and mottled. The corollas are large and white, It is a creeping lant, and grows well in places suitable for tropical epiphytal Orchidea. Light peat soil or leaf mould suits the speries est. The other species require the same treatment.
3096. Heintzia tigrina is a robust soft-stemmed soft-leaved subshrub, 3-4 feet high. The leaves are a foot long, reen, with a bluish tinge. The calyx is large and rose-coloured, also the bracts. The corolla is white, an inch long; e segments studded on the face with soft hairs, which produce a silky and spotted with purple gloss. It is a coarseoking plant, the flowers hid by the leaves. It flowered for the first time in this country at Messrs. Henderson's rrsery, near London, in 1849.
3097. Moussonia élegans is a pretty shrub, and requires a temperate stove. The stem and leaves are soft and de, with lines of purple spots ; the throat yellow. The colla is scarlet, about half an inch long; the segments yellowish inde, with lines of purple spots; the throat yellow. The plant is of the most easy culture and propagation.

History，Use，Propagation，Culture，
3098．Abèlia．These shrubs are generally treated as rather tender，and are either kept in a frame or a cold part of ： greenhouse，but are probably hardy enough to stand our milder winters．Rough sandy loam，with the addition of ： little peat，is the soil that appears to suit them best．They are free growers，and therefore require plenty of wate during their growth．Cuttings from young wood strike root readily．The flowers are sweet－scented．

3099．Spathodea le＇vis is a pretty plant，and grows best in a mixture of light loam and sand，and cuttings strike roo if planted in white sand．The corollas are white，spotted and streaked with red．S．speciosa is a splendid plant with terminal panicles of pink fowers，stained with purple．It has been cultivated in a mixture of decayed leave and rotten dung，mixed with one third of peat and one third of loam．Cuttings are said to be difficult to strike．

3100．Adcnocalymma comosum is a splendid climber；trained to the rafters in a stove it makes a fine appearanci with its copious flower buds，which look like large clusters of hops；and as soon as the bracts fall the conspicuou yellow blossoms burst forth in all their beauty．It requires the same treatment and culture as the climbing hothousi

19697 Branches downy, Leaves ovate distantly serrated glabrous except the midrib beneath, Peduncles 2 -flowered, In19698 Leaves ovate obtuse reticulated glabrous ciliated, Peduncles neariy terminal axillary l-3-flowered bibracteate, volucrum small 1-3-toothed, Corolla tubular nutant, Stamens and style exserted

[elongated, Calyx segments ovate 9724 Glandular downy, Lvs glabrous spinosely ser., lower ones spatu. middle ones obl. upper ones roundish, Panicle 19725 Tall, Leaves lanceolate, upper ones stem-clasping acum. smooth, Panicle long leafy at base, Peduncles ehort more than 1-flowered, Tube of Corolla bell-shaped, Sterile filament smooth

and Miscellaneous Particulars.
species of Bignonia, from which it has been separated. A. nitidum is said to be a shy flowerer, and bas been found to grow best in a large tub, in a mixture half light loam, a quarter peat, and a quarter leaf mould.
3101. Colea floribunda is a noble plant, with a perfectly simple stem, furnished with large pinnate leaves at the top only, and bearing flowers of a bright yellow ochre on the old wood, from just above the place whence the leaves had fallen the previous year. The culture and treatment are the same as for the upright hothouse species of Bigndmia.
3102. Phylläthron Bojerianum is a beautiful and singular plant. The leaves or broad petioles are curious, being composed of two joints. The plants require the same treatment as the upright hothouse kinds of Bigndnia.
19722. Pentstemon cordifólius has littje the appearance of the genus in habit, but being a trailing shrubby plant it is well-fitted for decorating rockwork. The flowers are of a rich dull red or scarlet.
19725. The Pentstemon gentianoides figured in Bot. reg. and Bot. mag. with long narrow scarlet fowers should be called S. Hartwegit, according to Paxt. Fl. gard. ; but why, we are not told.

History, Use, Propagation, Culture,
3103. Tetranèma mexicàna is a pretty little plant, hlossoming profusely. It is easy of cultivation, and is propagated readily by division and seed. A light rich soil suits it best.
19730. Martúnia fràgrans is a half-hardy annual. The flowers are large, of a beautiful purple, and very fragrant. The culture and treatment are the same as for Balsam.
3104. Dilivaritia ilicifoliza is a pretty holly-leaved plant. It can only be propagated by seed.
3105. Asteracintha requires the same culture and treatment as recommended for Barlerria.
3106. Stemonacinthus. The same treatment and culture as recommended for the species of Ruéllia will suit this plant.
3107. Sericógraphis is a very handsome winter-flowering plant. The flowers are tubular, of a bright purplish red. The cuitivation and propagation of the plant are the same as for Ruéllia.
3108. Salpixintha coccinea is a splendid shrub, with its pretty graceful scarlet pendent blossoms. its culture and propagation are the same as for Ruéllia.

19726 Stem downy, Leaves ovate-lanceolate entire glabrous, Segments of Calyx ovate, Corolla downy beardless, Sterile stamen glabrous, Peduncles 2-fowered downy
\(\beta\) Flowers pale below semidiaphanous, Stems green, Calyx and Corolla glandularly villous
[Cor. vent.

19728 Tall green, Leaves oblong-spatulate, cauline ones lanceolate sessile stem-clasping entire, Peduncles manytowered axillary forming a spicate leafy panicle
19729 Almost stemless, Peduncles long numerous, Flowers corymbose
19730 Leaves cordate angular coarsely toothed nearly opposite on long petioles, Raceme few-flowered, Calyx campanulate oblique plicate, Bracts plano-convex, Flowers tetrandrous, Plant villous
19731 Spiny or nearly unarmed glabrous, Leaves elliptic sinuately toothed spiny wavy, Spike many-flowered, Flowers bracteate showy

19732 Rather hairy, Stem quadrangular, Leaves lanceolate tapering to the base narrow sessile serrately ciliated [lyx pilose with subulate segments, Corolla long slender curved, lobes nearly equal, Seeds orbicular ciliated 19733 Glabrous, Leaves ovate bluntly acuminate entire, Spikes downy panicled at base, Flowers solitary sessile, Ca-
[Coroila long slender curved, lobes nearly equal wavy
19734 Glabrous, Leaves ovate pointed wavy entire, Flowers twin terminal, Segments of Calyx foliaceous subulate, 19735 Hairy pubescent, Leaves ovate acuminate coarsely serrated on long stalks, Flowers terminal usually solitary on tops of branches bracteate, Calyxes ciliated
19736 Leaves ovate acuminate entire glabrous blotched with white on short petioles, Peduncles solitary axillary and terminal bibracteate usually 2-flowered, Bracts leafy
19737 Leaves stem-clasping elliptic-oblong narrowed to base and auricled hairy, Spikes axillary imbricate leafy 19738 Hispid, Leaves obovate-elliptic dentately crenated lined above, Spikes terminal by threes glandular
19739 Hairy, Leaves sessile ovate acuminated crenated, Spikes axillary opposite and terminal, Bracts ovate cuspidate
19740 Leaves lanceolate equal remotely serrulated 7-nerved
19741 Leaves ovate roundish cuspidate unequal coarsely crenated, Spikes axillary opposite solitary globose on short peauncles hairy, Bracts lanceolate entire
19742 Leaves ovate-lanceolate entire downy, Peduncles axillary dichotomous panicled, Bracts linear, Stamens exserted

19743 Glabrous, Leaves oblong-lanceolate, Flowers in loose l-sided downy panicles, Lips of Corolla nearly equal
19744 Glabrous branched, Leaves ovate coriaceous entire, Peduncles axillary solitary pendulous or terminal by threes, Flowers sessile decussate in loose spikes
19745 Glabrous, Leaves oblong-lanceolate acuminate, Flowers arranged in quadrangular close spikes formed of keeled large bracts

19746 Leaves oblong-ovate entire undulated, Racemes terminal secund deflexed

\section*{19747 Flowers pedunculate axillary solitary, Bracts large}

19748 Downy erect-branched, Leaves ovate acuminated ciliated, Flowers twin axillary sessile bractless, Segments of Caljx subulate, Tube of Corolla curved, lobes equal crenated, Capsule downy 10 - 12 -seeded
19749 Branches diffuse, Leaves cordate-ovate, Racemes axillary elongated secund strict, Segments of Calyx acuminated

\section*{and Miscellaneous Particulars.}
3109. Strobilórachis glàbra is very nearly related to Aphelándra, and should be cultivated and treated like it
3110. Whitfieldia lateritia is a beautiful shrub, having the branches terminated by racemes of flowers, of rather a large size. The calyx and corolla, and often the large bracts, are of one uniform brick-red colour. The plant requires plenty of heat and moisture while growing; and cuttings strike root readily.
3111. Petaľdium barlerioìdes is a very pretty shrub, with much the habit of Barlèria, from which it has been separated. It is of the most easy culture, and a free flowerer. Loam and peat, with a little rotten dung mixed with it, is found to be the best soil for it. Cuttings from young wood strike freely in the same kind of soil.
3112. Dipteracánthus should be cultivated and propagated like Petrlidium.
3113. Asystàsia is a genus of very pretty plants, of easy culture. They require a hot moist atmosphere. A compost of peat and loam, with the addition of a little leaf mould, suits them best, and cuttings strike root readily. A. scandens bears clusters of large cream-coloured flowers, tinged with blush, and is well-fitted for training on trelliswork.

> History, Use, Propagation, Culture,
3114. Hydroméstis maculàtus. The same culture and prop. as Aphelándra. Readily increased by cuttings or seed. 3115. Hexacéntris mysorénsis. Among all the plants exhioited in 1852, none excited such universal interest as this plant. It formed a small umbrella-like creener, trained over trellis, the whole circumference of which was loaded with pendulous racemes of the most beautiful large yellow and crimson flowers. The culture and propagation of the species are the same as for Thunbergia.
3116. Meyénia Hawtayneana is a splendid climber. It should be treated like Thunbérgia.
3117. Mastacánthus sinénsıs is an autumn-flowering plant, and furnishes rich violet blossoms at a late time of gear. It grows freely in sandy loam and peat, and requires plenty of room for its roots, and plenty of water when

19750 Leaves obovate or ovate acute glabrous, Racemes terminal compact thyrse-formed, Segments of Calyx linearlanceolate, Tube of Corolla widened and recurved ahove, lobes of limb crenately curved, Stamens glandular
[ing water
19751 Leaves ovate-lanceolate entire petiolate, Spikes terminal solitary with imbricate cucullate bracts or scales hold-
[ovate acuminate keeled serrated, Upper lip of Corolla lanceolate erect, lower one large 19752 Leaves ovate glabrous tapering into the thick-winged petiole, Spike simple thickened rather tetragonal, Bracts

19753 Lvs cordate angular on naked petioles, Peduncs short l-flowered, Calyx trunc., Bracts ovate ciliated, Anthers sagittate glandular at base, Glands pedicellate, Style bearded at top, Stigma foliaceous 2-lobed
19754 Leaves cordate entire, Flowers scarlet
19755 Leaves oblong acuminated 3-nerved a little toothed obtuse at base or hastate, Bracts of Calyx small, Lips of Corolla 2-lobed, upper lip galeate, tube shaggy at base inside
19756 Leaves cordate entire coriaceous, Flowers purple

19757 Arboreous downy, Lvs rhomb-cordate sometimes 3-lobed tomentose beneath, Thyrse many-flowered, Corolla downy bilabiate
[above silky beneath, Heads of flowers oblong or globular 19758 Shrubby, Branches bluntly tetragonal, Leaves opposite or in threes oblong acuminate sharply serrated scabrous 19759 Rhizoma creeping, Stems erect 4-angled, Lvs obl.-lanc. coarsely toothed, Heads of Flws nearly globose yellow 19760 Spreading suffruticose with rooting branches, Leaves obovate-cuneate sharply serrate, Heads of Flowers subovate at lergth cylindrical

19761 Leaves ovate oblong petiolate obtuse coarsely serrated downy, Peduncles axillary fastigiate

> History, Use, Propagation, Culture,

3120．Pterodiscus specidsus is a splendid plant belonging to the Pedalinea．The root is tuberous，large，and solitary， quite globose，the upper part elevated above the earth，and produces from its summit a stem which soon divides into several erect succulent branches bearing opposite leaves and large handsome reddish purple flowers．
2679．Torenia．All the species here mentioned are very similar in habit，and are very pretty plants；now very generally cultivated in our hothouses and orchideous houses．They are trailing plants，grow in baskets like Eschynánthus，and may be trained in any way．They grow readily in any loose soil，and are readily increased hy cuttings or division．Moist atmosphere is necessary．T．asiática is a most elegant plant，and is spread all over India， The flowers are splendid，of a bluish purple velvety colour，with three darker purple blotches on a pale ground．
19797．Browállia Jamesònii is a showy shrubby plant four to six feet high，bearing corymbose cymes of yellow flowers．It thrives best in a warm part of a greenhouse．Light loam，sand，and peat，has been found to suit it well． In summer it will do in the open air，planted against a wall，or in a sheltered situation．Cuttings strike freely．

19776 Leaves opposite oblong sinuately toothed, Petioles short with one gland on each side, Flowers axillary solitary
19777 Leaves lanceolate acute serrated smooth, as are the branches
19778 Leaves obovate serrated, Flowers numerous white spotted with violet
19779 Leaves ovate-lanceolate serrated entire behind shining and clammy as are the branches, Flowers axillary
19780 Sepals 1-3-nerved entire or toothed in front below gradually narrowed into 1-2 subulate points, Corolla tubularly bell-shaped slightly curved at base, Lips denticulate, upper lip not notched, Stamens hairy
19781 Slender-branched glabrous, Leaves alternate subulate, Flowers racemose, Spur arched very long, Peduncles and Calyx pilose, Upper Lobes of Corolla obtuse, lower ones emarginate, Calyx reflexed
19782 Clammy and villous from glandul. hairs weak, Lrs opp. ovate roundish, lower ones peti. toothed obt., upper one sess.ent., Flws nearly sess., Cor. small, upper lip dark purple, lower one and palate yel., Spur incrvd white
19783 Ascending, Leaves linear channelled rather feshy glaucous, Flowers loosely racemose brownish yellow, Sepals linear obtuse, Spur shorter than corolla, Palate adpressed downy
19784 Villous, Radical Leaves subspatulate deeply toothed, rameal leaves deeply tripartite having the middle lobe large and more or less denticulate
\(\beta\) Flowers with numerous large distinct spots of white
[hairy, Beak linear twisted twice as long as helmet 19785 Tall, nearly simple pilose, Leaves pinnatifd, Segments serrate-crenate or sub-bipinnatifid, Spike dense, Calyx [der lip, which is hooded and 3-lobed, Segments emarginate 19786 Leaves pinnatifid, Segments doubly toothed, Spikes long, Beak of Corolla narrow spirally twisted below the un19787 Tall branched hairy, Leaves bipinnatifid, segments deeply toothed, Spikes slender interrupted, Teeth of Calyx crested, Helmet narrow-oblong exceeding the lip
19788 Racemes pendulous dense many-flowered, Leaves oblong-lanceolate a little toothed, Flowers nearly sessile, Calyx narrow plicate, teeth unequal, Tube of Corolla slender
19789 Clammy erect downy, Leaves oblong or lanceolate glabrous above toothed or entire, Peduncles shorter than leaves, Calyx elongated plicate with lanceolate lobes

19790 Diffuse glab. or a little hairy, Lvs ovate or ovate-lanc. acum. serrately crenated, Calyx with 5 nearly equal ribs or 3 narrow winged ones, Teeth of front Filaments subulate
[gregate, Filaments all toothless 19791 Downy, Leaves broad-ovate subcordate coarsely serrated, Peduncles axillary solitary or terminal and rather ag19792 Diffuse downy, Leaves ovate roundish and cordate serrated, Calyx elongated with 5 equal acutely keeled ribs, Teeth of front Filaments short obtuse
19793 Leaves lanceolate-acuminate jagged glabrous, Racemes subsecund, Corolla downy, Segments ovate bearded, Bracts all shorter than pedicels
19794 Leaves ovate lanceolate acute subcordate at base glabrous, Stem and Petioles winged, Cymes lax few-flowered 4-8, Sepals roundish with membranous edges, Staminodium bifid with diverging lobes

19795 Lvs ovate acute tapering to base, Peduncs l-flwd axil. racemose at tops of brnchs, Brnchs and adult calyxes glab. 19796 Lvs opposite or altern. ovate acum., Pedun. axil. sol. I-flwd, Calycine segs subulate, Segs of Cor. ovate acum. 19797 Shrubby downy, Leaves ovate rugose, Flowers subcorymbosely cymose, Pedicels short, Calgx ovate tubular oblique, Corolla with an incurved wide tube and shorter segments
19798 Hispid, Leaves equal ovate oblique at base sparingly serrated, Limb of Corolla wide
[Spur conical 19799 Pilose, Lvs ovate acum. hispid above serrate, Cal. downy, Tube of Cor. shorter than limb, which is spreading,

3121. Achimènes. The species are increased by the scaly caterpillar-like tubers, which are produced in quantities. A compost of loam, peat, and sand, in equal proportions, is found to suit them best. In the autumn, when the plants A come done fowering, and the stems become dead, the tahers may be kept in the soil till spring, giving no water, in the same way as recommended for bulbs. But in spring, when they begin to grow, they should be repotted in fresh mould. When growing they require plenty of water. Four to six tubers in a pot will be sufficient. The p'ants are very elegant, and have become great favourites. They are best grown in a close frame or pit, and when they are in flower may be removed and placed where they will be seen to the best advantage, in a stove, or conservatory, or greenhouse. Heat and moisture seem to be requisite to their growth. By planting in January, February, and March, plants may be had in blossom most of the vear.
Trevirana putchélla, No. 8893. in the body of the work, is the original species of Achimènes, and is as beautiful a plant as any of the more recently introduced species.

[lose, Segments linear, Corolla clavate, segments obtuse with a dark mark at top equal, Antherj purple 19828 Lvs lanceolate acuminate slightly denticulated, Uimbels nearly sessile terminal many-flwd, Calyx 5 -parted pi19829 Much-branched radicant, Leaves oblong acuminate, Umbels term. many-fiwd, Corolla sub-clav. clothed with glandular hairs

\section*{and Miscellaneous Particulars.}
and leaf mould, or turfy peat, is said to be the best soil for it, and care should be taken not to over-water it in winter It is cultivated like Orchidea, in a warm moist atmosphere, during the season of its growth, and strikes root readily from cuttings.
3126. Klugea Notonidna is a soft-stemmed decument plant, flowering freely in a warm stove. A mixture of loam and peat is found to be the best soil for it, and it appears to like moisture. The flowers are blue, disposed in onesided racemes.

31\%7. 平schynánthus grandifidrus succeeds well if planted in pots, although in its native country it is an epiphyte. In fact, all the species should be cultivated the same as tropical epiphytal Orchidea, in baskets or on blocks of wood. Heat and a moist atmosphere are necessary. All the species are splendid plants when in blossom, and worth cultivating in every hothouse or orchidaceous house.

History, Use, Propagation, Culture,
3128. Agalmyla staminea is a splendid plant when in blossom, and is nearly related to Fschynanthus. The flowers are of a bright scarlet colour. The stems are creeping and throw out roots at the joints. It requires the same treatment as the species of Eschynánthus, and should be potted in turfy peat mixed with a portion of loam and sand. Good drainage is necessary : for this purpose the pots should be half-filled with potsherds, and a few stones should be mixed among the soil.
19848. Collinsia multicolor is a very pretty tall annual plant. It comes near to C. bicolor. The floral leaves are purple. The middle lobe of lower lip is crimson, but the rest of the lower lip is lilac ; and so is the upper lip, except that there is a broad white spot in its middle relieved by numerous blood-coloured dots. The plant has a good effect when grown in large patches or beds.
3129. Chenóstoma consists of a great number of known species, and is separated from the old genus Manitlea. They require the treatment of Verbena, and are like them well-suited for bedding out in the same way. In order to

19830 Lvs oblong-lanceolate acuminate convex dotted beneath, Bracts membranous oblong concave, Sepals 5 oblong [obtuse, Limb of Corolla flat, upper lip emarginate, lateral ones truncate 19831 Lvs oblong-lanceolate acuminate serrately-toothed, Flowers fascicled axillary, Bracts minute subulate, Caly \(x\) 5-parted, segments subulate, Cor. fringed, Stamens exserted

19849 Branches hairy at top, Leaves oblong-lanceolate or linear entire, Flowers racemose, Calyx segments linear exceeding the capsule but 3 times shorter than tube of corolla
19850 Much branched, Branches downy panicled, Leaves ovate toothed, upper ones oblong glabrous or canescent beneath, Racemes loose, Calyx hispid
19851 Rather hairy, Leaves lanceolate ciliated entire, upper ones smaller bract-formed, Peduncles solitary slender, Middle segment of lower lip of Corolla furnished with a long horn which is bidentate at top
19852 Cvd with gland. down, Lvs lanc. acum. serrated, floral ones broader at base bract-formed exceeding the pedicels 19853 Suffruticose glabrous, Leaves narrow distantly toothed, Racemes terminal erect many-flowered

19854 Leaves ovate cordate at base acute undivided or 3-lobed hairy beneath, Panicle terminal covered with rusty tomentum

19855 Erect or ascending villous, Leaves ovate, upper floral leaves shorter than calyxes, Flowers axillary solitary, Corolla 3 times the length of calyx
19856 Leaves obovate-oblong or elliptic hardly acuminate glabrous or hairy beneath on the midrib, Cymes g.-4-fiwd, Calyx large tubular inflated glabrous, Tube of Corolla scarcely exceeding the calyx
198.57 Lis broad-elliptic acutish, Bracts lanceolate acuminate glab, as are the calyxes, Flws few subracemose terminal 19858 Lvs obl, acuminate glab. ciliated, Bracts lanc. acuminate glab., Calyx glab., Flws few subracemose terminal 19859 Lvs oblong-lanceolate not shining, Flowers terminal about 2 together, Limb of Corolla \(2 \frac{\pi}{2}\) inches across

and Miscellaneous Particulars.
have a sufficient number of plants for that purpose cuttings should be struck in autumn, kept in any part of a frame or greenhouse during winter, and turned out in the summer.
3130. Paulòwnia imperialis is very similar in habit to Catálpa syringafolia, but is not so hardy, for the young shoots are generally killed by the frost in winter, and consequently it does not often flower in the open ground in this country It has, however, flowered at Paris frequently. The flower has the different shades from blue to purplish lilac. It may be propagated by pieces of the root. It is altogether a splendid tree both in flowers and foliage.
3131. Lindenbérgia urlicifolia is a plant of easy culture; and it readily produces seeds, by which it is propagated. 19856. Franciscea calycina is a fine shrub when in fower. The flowers are at first blue, but decay to white Loam and peat, and a portion of sand, is found to be the best soil for it. The production of fine heads of flowers depends upon its vigorous growth, therefore the plants must be placed in bottom heat, and shifted from size to size of pots as they become filled with roots. The other species require the same treatment.

\section*{Order I．TRIANDRIA．Stamens 3.}

3134．1452a．Rigidélla．Sepals with boat－formed imbricating claws and reflexed lamina．Petals very small， straight，with short linear laminæ．Anthers sessile on the column，with lateral cells．Stigmas 3 bipartite，appendicu－ late at back．Flowers pendulous．Capsule papyraceous，many－seeded，3－valved at top．Seeds dotted，subglobose．

History，Use，Propagation，Culture，
3132．Ionopsidium acarile is a pretty little annual，will grow in any rich damp soil，or on the shady side of rock－ work．It makes a neat edging to borders in shady places．The flowers are at first white，but turning to lilac．It may be propagated either by seeds or by runners，which it throws out in damp soil．
3133．Gira＇llsia saxifragifolia has much of the habit of Saxifraga granulata，and the flowers are much like those of \(A^{\prime}\) rabis alpina．It does well with the treatment of ordinary alpine plants．It is a pretty little alpine plant smelling

19860 Leaves large obovate-oblong, Bracts deciduous lanceolate pilose ciliated, Racemes compound terminal large \(\beta\) Calyx broader and as well as bracts smooth
[hemispherical
[long tube and flattish limb, Valves of Capsule coriaceous 19861 Glabrous, Leaves obovate-oblong acute, Flowers solitary, Calyx campanulate deeply 5 -cleft, Corolla with a \(\beta\) Flowers larger than in the species

19862 Leaves opposite linear-lanceolate sharply-toothed tapering to both ends, Racemes terminal
[of Corolla exceeding the tube, Capsule oblong longer than calyx 19863 Tall, Branches twiggy, Leaves obovate spinosely toothed, Racemes elongated terminal sub-compound, Segments 19864 Leaves oblong obtuse tomentose as are the branches, Segments of Corolla longer than the tube, Corolla white streaked with bluish purple
3133. 1407b. Gra'llsza. Calyx equal at base. Petals on short claws with entire limbs. Stamens toothless. Silicle elliptic flat, 1 -celled from the septum being absent, apiculated by the Stigma. Funicles free, a little thickened at base. Cotyledons fiat. Radicle accumbent.

19865 Lower Leaves like Cynoglóssum, upper ones narrower wavy, Flowers large in close racemes, Corolla bright violet
19866 Cauline Leaves oblong half stem-clasping subcordate sinuately toothed scabrous from branched down, Racemes terminal, Pedicels longer than Calyx, Siliques linear elongated erect
19867 Suffruticose at base panicled, Leaves lanceolate repandly toothed wavy downy, Pods nearly orbicular 4 -seeded Seeds margined
19868 Leaves ovate-roundish entire on long petioles, Pedicels radical, Pods roundish emarginate

19869 Glabrous, Stems many, Radical Lvs stalked reniform palmately and deeply toothed, cauline ones ovate 3-lobed, uppermost ones linear, Racemes corymbosely umbellate

19870 Pods'2-celled 2-seeded obcordate crowded, Valves winged on the back entire, Leaves linear distant adpressed
19871 Suffruticose, Radical Leaves glaucous oval-lanceolate slightly-toothed, cauline ones linear, Silicles linear glabrous crowned by the sessile stigma a little constricted in middle and narrowed at base
19872 Glabrous green, Siliques moniliferous spreading and pendulous, Lower Leaves trifid rarely pinnately 5 -cleft with filiform lobes, upper leaves entire, Lateral Stamens furnished each with a toeth
19873 Leaves 3-4-foliate, Leaflets oblong-lanceolate acute at both ends entire, Sepals connate at base, Petals oblongelliptic nearly sessile, Stamens equal, Fruit linear longer than stipe
3135. 1452b. Hydrota'nia. Perianth campanulate, nearly equal. Petals unguiculate, marked by a triangular zone above the claw. Anthers sessile. Ovarium free, conical, many-seeded. Style filiform, trifid at apex : Spgments tripartite, linear, convolute.
3136. 1452c. Beatonia. This genus differs from Tigridia in the anthers beipg broad at base, becoming gradually smaller to the top, decurved; and in the forked lobes of the style having a minute crest placed within the fork and terminated by a minute stigma.
3137. 145\%a. Phalocallis. Perianth crateriform. Larger Sepals spreading. Petals revolute. Filaments connate

\section*{and Miscellaneous Particulars.}
strongly of garlic. The plant is well-fitted for ornamenting rockwork.
19871. Isditis indigótica is called Tein-ching by the Chinese; and is considered by them as a plant of great importance; as, according to Fortune, it covers a large tract of country. It is grown in rows, and in June the plants are from 6 inches to 1 foot in height, and are then considered in perfection for the manufacture of Chinese indigo or road.
at base, reflexed at top. Cells of anthers agglutinate above the style, which is trigonal and 3-lobed at top. Stigmas short, transverse, 2-lobed, obtuse, emarginate. Crests of lobes 2, petaloid, reflexed. Capsule triquetrous, oblong, membranous. Operculum obsolete, indehiscent. Seeds flattish, angular, marginate.

\section*{Order 2. PENTANDRIA. Stamens 5.}
3138. 1459a. Disémma, Calyx 10-lobed: Tube short, sulcate below. Crown of throat double: outer one of distinct threads ; inner one combined into an entire or toothed membrane. The rest as in Passiflora.
3139. 1459b. Tacsònia. Tube of calyx long. Limb 10-lobed. Throat furnished with a scaly membrane. The rest as in Passiflora.

Order 3. HEXANDRIA, Stamens 6.
3140. 1460a. Gelasine. Perianth regular, annulated at base. Stamens 6, monadelphous, but partible. Anthers forming a cylinder. Style filiform. Stigma 3-lobed. Capsule obovate, 3 -valved, opening at the sutures at top. Seeds angular, truncate at top.

\section*{Order 4. OCTANDRIA. Stamens 8.}
3141. 1462a. Luvanga. Calyx truncate, obscurely 4-lobed. Petals 4, oblong, fleshy. Stamens 8, united into a tube. Anthers linear. Style cylindrical. Stigma subglobose, entire. Berry oblong, somewhat 3-lobed, 3-celled, pulpy. Pulp resinous, odoriferous. Seeds solitary, Albumen none.

\section*{Order 5. DECANDRIA. Stamens 10.}
3142. 1464a. Wallsirra. Calyx 5-toothed. Corolla of 5 petals. Nectary double : outer one cylindrical, bearing the anthers in its mouth; inner one a fleshy ring round the ovarium. Ovarium 2 -celled. Cells 2 -seeded. Berry 1 -seeded.
3143. 1464b. Cheirostèmon. Calyx 5-parted, tribracteate. Sepals deciduous, coloured inside, foveolate at the base, 5 inches long in the bud. Petals wanting. Filaments conuate into a tube which is cleft at top, with the lobes leaning to one side, exserted, and bearing on the back of each lobe 2 anthers. Stigma acute. Capsule 5-angled, 5-celled, 5 -valved, with a villous dissepiment in the middle of each valve. Seeds egg-shaped, carunculate; 15 or 18 in each cell.
3144. 1464c. Napoleòna. Calyx coriaceous, 5 -cleft. Corolla of 3 monopetalous verticels : outer one large, multiplicate, many-toothed; middle one like the corona in Passiffdra, that is, cleft into filiform segments to the base ; inner

History, Use, Propagation, Culture,
3134. Bigidélla are pretty bulbs with scarlet flowers, requiring the treatment of Tigridia.
3135. Hydrote'nia. The genus are very pretty plants when in blossom. They are greenhouse bulbs of easy culture. They should have no water after the leaves begin to fade, until they begin to grow again in spring, when they should have plenty. A dry shelf in a greenhouse is a good place to keep them during winter. Equal parts of
one erect cup-shaped, having its margin inflexed and multifid. Stamens 10 , in a single series, monadelphous. Filaments membranous, inflexed. Anthers adnate, 2 -celled. Disk annular, somewhat cup-shaped. Ovarium adherent, fleshy, 5 -celled, 20-ovulate. Style peutagonal, the angles winged. Stigma disk-formed, 5-rayed.

\section*{Order 6. DODECANDRIA. Stamens 12.}
3145. 1467a. Astíria. Involucel 3-leaved, deciduous. Calyx 5-cleft. Petals 5, twisted. Stamens 20, unequal, combined into an urceolus without any sterile stamens. Ovarium 5-celled. Styles 5, spatulate. Ovula 2 in each cell, ascending.
3146. 1470b. Asterotrichion. Calyx campanulate, 5 -cleft, with 5 nectariferous pits in the bottom. Petals 5 , unguiculate joined together a little at base. Stamens 10-15, fertile; outer ones shortest. Anthers reniform, 1-celled, opening by a transverse chink. Ovarium 2-celled. Cells 1-ovulate. Ovula pendulous. Styles 2, clavate, enclosed. Stigmas thickened truncate. Perhaps diœecious.

\section*{Order \%. POLYANDRIA. Stamens indefinite in number.}
3147. 1471a. Calliändra. Calyx campanulate, bidentate, rarely 5-cleft Corolla funnel-shaped. Stamens indefinite, much longer than corolla, joined into a tube at base. Legumen linear, compressed, pulpless.
3148. 1479a. Lopimia. Involucel longer than calyx. Calyx of 20 bristle-like connivent leaflets. Corolla flat. Column of stamens deflexed. Stigmas 10. Anthers 30-40. Capsule of 5 carpels. Carpels indehiscent, covered with mucilaginous glue.
3149. 1482a. Fugд̀sia. Calyx 5 cleft, girded by a 6-12-leaved involucel. The leaffets bristle-formed very short, Anthers numerous, from the sides and lower part of the staminiferous column. Stigmas 3-4, adglutinate or free, clavate. Capsule 3-4-celled, 3-4-valved, 3-4-seeded. Seeds naked or covered with short wool.
3150. 1490a. Goe'thia. Calyx campanulate, 5 -cleft, surrounded by a large bladdery involucel. Petals 5 , somewhat joined together at the base, twisted in the bud. Stamens numerous. Style elongated, cleft at apex into 8-10 stigmas. Carpels 5, coriaceous, l-seeded.
3151. 1490b. Trochètia. Calyx 5-parted, spreading, naked. Petals 5. Stamens 20-25, of which 5-7 are sterile. Ovarium solitary, roundish, scaly. Style filiform. Stigma 5-lobed. Capsule 5 -celled, 5-valved. Seeds small, roundish wingless.
3152. 1495a. Polýspora. Calyx girded by accessory bracts. Sepals and Petals 5. Stamens numerous. Style crowned by a 4-5-lobed stigma. Capsule conical, 5-celled, 5-valved, many-seeded. Seeds imbricate, ending in a wing.

\section*{TRIANDRIA.}

19874 Leaves linear green glabrous as are the scapes, young leaves finely ciliated, Scape length of leaves, Spathe many-flowered, Immer Keel tomentose, Anthers triangular
19875 Sepals obtuse flame-coloured marked at base with deep purple stripes
[the slender stigmas, Pollen yellow
19876 Seps acute \(1 \frac{3}{3}\) inch long scarlet with paler claws, Pets yel. cordate acum., Anthers acute broad at base equalling
19877 Leaves lanceolate, Bracts joined sheath-like, Flowers terminal fascicled nodding, Sepals scarlet with a black spot at the base of each
19878 Flowers marked like those of Fritillària meleàgris
19879 Flowers yellow speckled with purple, Claws of Petals faced with hyaline globules

19880 Stem forked, Leaves ensiform, Spathe margined with white, Flowers small campanulately rotate
brown lamina
19881 Stem 2 feet, Leaves plicate 1 to \(1 \frac{1}{2}\) foot, Spathe 2 -valved \(2 \frac{1}{2}\) inches, Sepals with pale green spotted claws and dark 19882 Stem slender, Livs plicate 8 inches, Spathe I-valved, Peduncs curved, Perianth yellowish, spotted with purple
[claws, Petals small recurved, Lobes of Stigma fringed at top with a crested membrane between 19883 Leaves broad plicate 6 inches, Stem 4 inches, Spathe 2 -flowered, Ovarium obovate, Sepals spotted with white on

and Miscellaneous Particulars.
oam, leaf-mould, and sand will suit them best. Perhaps they may succeed in the open air with the same treatment is Tigridia.
3136. Bealonia. Plants with much the uppearance of species of Tigridia, and the bulbs require the same managenent and treatment.

\section*{History, Use, Propagation, Culture,}
3137. Phalocállis plumbea has much the habit of Márica Northiana, and the colouring of the flowers is almost the same. The plant will grow in rich light soil. It requires a good deal of moisture when growing: in fact, it may be cultivated exactly like Márica.
3138. Disemma. The species of this genus require the same treatment as those of Passifldr.
3139. Tacsonia. The species are truly handsome climbing plants, deserving a place in every greenhouse and conservatory. They are readily increased by cuttings, require the same treatment as Passiflora, and might prove hardy in warm sheltered situations. Loam, peat, with decayed leaves, and a little sharp sund, is said to suit them best.

19884 Habit of Märica, Leaves glaucous plicate, Stem 2-4 feet, Flowers solitary terminal spotted, Spathe 3 inches

\section*{PENTANDRIA.}

and Miscellaneous Particulars.
3140. Gelasine azurea. This is a very pretty plant, with the habit of More'a, and will thrive in a mixture of loam, 3140. Gelasine and sand, and is increased by offsets.
3141. Luvánga scándens. This is a climbing hothouse plant. It will grow in any light rich soil, and can be easily ncreased by cnttings in the usual way. The plant may be trained to a rafter or trellis.
1464. Brownea grándiceps and Arixa require to be grown in a moist stove. A rich free soil is the best for themlanted out in a border, or in a large tub, they form splendid objects. The best way of propagating the species is by eeds, when they can be procured, which germinate readily in a hotbed.

> History, Use, Propagation, Culture,
3142. Wallsura. The \(W\). robústa is a large timber tree; and the bark of \(W\). pisc dia thrown into fishponds soon causes the fish to float upon the surface of the water, as is the case with Indian berries (Cocculus indicus), rendering the fish easily caught; and the fish so caught is said to be not the less wholesome. The trees are cultivated and propagated in the same manner as ordinary stove plants.
3143. Cheirostemon platanoides is a noble tree, growing 15 feet in diameter, and 100 feet and more in height. It succeeds well in turfy loam and peat, or any light rich soil. Half-ripened cuttings will strike root under a hand-glass, but the leaves should not be shortened. It is generally called the hand-plant.
3144. Napcleona imperialis. This shrub has excited more than ordinary interest, arising partly from the circumstance under which it was first discovered, and partly from its name, given in honour of one of the most remarkable men that ever lived, and still more from the singular structure of the flowers as exhibited by Baron Palisot de Beauvais, so remarkable, indeed, that doubts have been expressed of the very existence of such a plant. It was discovered by him in the year 1786, in the kindom of Waree, in Benin, on the west coast of Africa; and the author justly prides himself upon the discovery of the Napoledna, as likely to constitute a new order of plants between

19909 Lvs pinnate, Leaflets 5 lanceolate, Panicles terminal and axillary, Filaments distinct consequently the exterior 19910 Leaves subternate, Leaflets oblong obtuse

19911 Leaves 5-6-lobed palmate-nerved, Flowers bibracteate hoary tomentose opposite the leaves, Stamens 5 joined at base and recurved at top giving the appearance of a hand
19912 Leaves rather coriaceous broad oblong acuminated, Flowers axillary apricot-coloured

\section*{DODECANDRIA.}

19913 Arboreous, Branches tomentose, Leaves large downy cordate serrated 3-lobed, Lobes acuminate, Stipules ovate acuminate, Peduncles elongated tomentose dichotomously umbellate, Petals lanceolate falcately flexuous
19914 Arboreous, Brnchs and Petioles hairy, Lvs cordate usually serrulated downy above tomentose beneath, Stipules ovate acuminate, Peduncles elongated, Corymbs compound, sepals reflexed, Petals obliquely spatulate
19915 Covered with stellate tomentum, Leaves roundish-cordate serrulated, Peduncles axillary, Cymes \(10-12\)-flwd, Leaflets of Involucel roundish a little shorter than calyx reflexed and deciduous
19916 Arbor., Brnchs clammy, lvs rndsh cord. 3-5-lbd ser., Lbs acum., Stips cord. acute, Peduncs axil. nearly term. sol. bibract., Bracts cord. concave keeled, Pedics and Cals hairy, Pets spreading, Ster. Fils elong., Anthers 15
19917 Lvs lanceolate acuminate serrated exstipulate pale green above but covered with scurfy stellate down beneath as are the branches, Flowers racemose at top of branches

19928 Prickly, Lvs large shining cordate 5 -7-lobed villous beneath, Stipules cordate acuminate, Peduncles axillary twin 1-flowered, Leaves of Involucrum 10 lanceolate, Calyx pentagonal hispid inflated in front
19929 Lvs digitate, Lbs lanc. acum. toothed smooth, Flws axil. sol. on long peduncs, Lvs of Involucrum 12-19 narrow

> and Miscellaneous Particulars.

Cucurbitàcea and Passifòrea. In 1843, Mr. Whitfield, a celebrated collector of objects of natural history, returned from one of his many voyages to Sierra Leone, and brought with him living and dried specimens of the plant. In 1848 one of the living plants brought home by Mr. Whitfield flowered in one of the hothouses at Sion House, the seat of the Duke of Northumberland.
3145. Astiria is rather a handsome tree, with pink fiowers. It is nearly related to Ruizia, and requires the same culture and treatment.
3146. Asterotrichion. The ordinary culture given to greenhouse shrubs will answer this plant.
3147. Calliándra. Pretty shrubs, with the habit of l'nga, requiring the same culture and treatment.
1992. Málva campanulàıa should be kept in a cold frame in winter, and planted out into beds in summer, where it will make a fine show.
3148 Lopimia malacophylla. This is a pretty plant when in blossom, at which time it has much the appearance of Chironia frutéscens. A inixture of loam, peat, and sand is a good soil for it; and half-ripened cuttings will root reely, planted in sand under a hand-glass in botcom heat. The best way of increasing it is by seed, if procurable.

3149. Fugdsia is a genus of pretty plants, which will grow best in a mixture of ioam, peat, and sand, and may be readily increased by cuttings or seed. They should be treated like greenhouse species of Hibiscus.
19943. Abùtilon esculentum is called Bencao de Diosin the province of Rio Janeiro in Brazil, where the inhabitants dress and eat the flowers with their viands.
3150. Goethia strictiflora is a handsome small shrub, with scarlet peduncles and calyxes, and whitish corollas. Any rich light mould will suit it, and cuttings strike root readily. The plant thrives best in a moist warm heat.

19930 Branched, Lrs glab. divided to base into many linear segments which are again divided, Segments of Calyx lanceolate, Corolla blue with a crimson base
[solitary 1-flwd bracteate, Invol. 1-leaved 10-12-parted 19931 Covered with stellate hairs, Lvs cordate 3-5-lobed, Lobes obovate obtuse sinuately lobed, Peduncles axillary 19932 Tomentose, Leaves palmate cordate 3-5-lobed, Lobes ohovate pinnatifid, Segments roundish rather crenate, Peduncles axillary 2 -fowered, Involucel 15 -toothed, Stigmas reflexed
19933 Branched, Lvs on long petioles ovate bluntish glabrous crenated or toothed, Petioles downy, Stipules subulate, Peduncles shorter than leaves
19934 Erect, Leaves bipinnate trifid or entire, Segments linear acuminated entire channelled rather fleshy, Peduncles axillary solitary l-flowered bibracteate, Corolla lilac with a dark base
19935 Glabrous, Leaves entire or tripartite filiform or trifid, Segments linear-lanceolate acuminate pinnatifid in the lower ones coarsely toothed, Involucel obsolete or 6-parted with subulate segments, Segments of Calyx acuminate 3-ribbed, Stigma clavate
19936 Glab., Lvs cord. deeply 7-lobed, Lobes lanc. acum. deeply ser., Stips subul. lanc., Peduncs axillary solitary 1flwd jointed at top, Calyx large camp., Tube glob. with 16 lamellæ, Petals broad spatu. conc. connivent veiny 19937 Leaves cordate 3-5-7-lobed, Lobes acuminated serrated, Peduncles terminal racemosely umbellate, Carpels biaristate at top
19938 Hairy and downy, Leaves cordate obsoletely lobed and toothed, Peduncles axillary solitary l-flowered, Petals imbricate yellow dark red at base, Carpels numerous downy incurved
19939 Leaves orbicularly cordate acuminated glabrous above but clothed with stellate tomentum beneath 5-7-nerved entire, Peduncles axillary solitary i-flwd, Flws large, Petals retuse yellow with an orange spot at base
19940 Glabrous, Leaves cordate acuminated serrated 7-nerved, Peduncles axillary solitary or twin jointed at top, Calyx covered with powdery down, Petals concave roundish painted, Fruit downy
19941 Brnchs hairy, Los downy 3-nerved at base, Stips subu., Peduncs axil. twin or tern 1-flwd hairy, Cal. ventric. 5 cleft, with reflexed segments, Petals concave roundish veiny
[globose villous mutic 13-16-celled
19942 Covd with rusty tom., Lvs ov.-lanc.obl. obt. acum. toothed at top tom. ben., Flws corymb. capit., Caps. sub19943 Clothed with grey down, Leaves cordate acuminate, Flowers axillary solitary, Cells of Capsule 3-seeded
19944 Glabrous, Leaves cordate 3-5-lobed coarsely toothed acuminate, Peduncles axillary siender, Calyx campanulate, Petals erect ornamented with dark branched veins
19945 Lvs large cordate crenated, Flws pendulous with broad rich crimson veins almost covering the white ground
19946 Glabrous, Leaves cordate serrated tapering much to the apex entire, Peduncles solitary, Calyx truncate at base, Corolla large subgiobose, Anthers collected into a globe exserted, Stigmas 10 capitate, Carpels 10

19947 Leaflets \(7-11\) oblong obovate cuneated at base acuminate at top glabrous, Flowers large, Tube of Calyx short truncate glandular at base, Petals very long white silky outside, Style slender, Stigma 5-lobed, Stamens yellowish red equal to petals, Anthers curved
19948 Leaves ovate acuminate coarsely and sinuately serrated at apex, Flowers axillary aggregate on short red peduncles, Involucrum red 4-leaved, Leaflets cordate, Corolla white
19949 Leaves oval acute a little toothed, Peduncles 3-4-flowered pendulous, Petals longer than calyx
19950 Lvs obl.-lanc. acum. glab. entire on short petioles, Peduncs solit. axil. I-flwd having 3-4 spatu. bracts under the flwr, Seps ov.-ellipt. concave rather hairy, Ovary hairy 5 -cld, Lobes of Stigma rndsh foliac., Caps, pea-formed
19951 Leaves obovate-oblong serrulated, upper ones entire, Flowers sessile solitary usually axillary cream-coloured, Styles 4 hardly unconnected
the 2 upper segments joined into a lip, which is bidentate at apex. Bracts longer than calyx. Style filiform, simple at apex. Legume oblong-compressed, stipitate ; the seminiferous suture wingless.
3155. 1551a. Cajanus. Calyx campanulate, 5 -cleft : Segments subulate, incurved at apex; the 2 upper ones joined together higher up than the rest. Corolla with an ample vexillum, which is bicallous at base, and an obtuse straight keel. Legume oblong-compressed, oblique, tomentose, 2-valved. Seeds many, nearly round, separated by membranous partitions.
3156. 1636a. Plagiolobium. Calyx bilabiate: Upper lip broad and retuse; lower lip tripartite. Keel obtuse. Ovarium sessile. Style persistent, unilateral. Legume inflated coriaceous, obliquely transverse, 2-seeded. Seeds strophiolate.

and Miscellaneous Particulars.
3151. Trochetia grandifidra is a pretty shrub, with pendulous red peduncles and white flowers. It will grow best n a compost of sand, loam, and peat, or leaf mould; and young cuttings will strike root readily. It requires a moist beat.
3152. Polyspora axillaris is a beautiful shrub when in blossom. A mixture of loam, peat, and sand will suit it, ind cuttings not too much ripened will strike root if planted in sand, placed under a hand-glass in heat, or it may be prafted on the single red Caméllia japónica.

3157．1552a．Wistaria．Calyx eampanulate rather bilabiate：Upper lip with 2 short teeth；lower lip with 3 subulate teeth．Vexillum bicallous．Wings conforming to the keel，which is 2 －edged．Legume on a short stipe，co－ riaceous，2－valved，1－celled，rather torulose at the seeds．

3158．1553a．Physaldbium．Calyx campanulate，bilabiate：Upper lip bidentate；lower one tripartite．Coralla： Vexillum shortly unguiculate，broad，orbicular，subreflexed，longer than wings，exappendiculate at base；Wings ad－ hering beyond the middle to the keel，which is incurved and obtuse．Ovarium many－ovulate．Style short，ascending glabrous．Stigma capitate．Legume oblong，turgid，coriaceous，many－celled．Seeds strophiolate．

3159．1553b．Harderbérgia．Calyx campanulate， 5 －toothed，subbilabiate．Vexillum orbicular，exappendiculate， hardly unguiculate，longer than wings，which are obliquely obovate－oblong．Keel adhering beyond the middle to the wings，incurved，obtuse．Style short，subulate．Stigma capitate，a little pencilled．Legume linear－compressed，some－ what many－celled，and many－seeded．Seeds strophiolate．

3160．1553c．Zichya．Calyx campanulate，4－cleft：Upper segment bidentate；the 3 lower ones approximating into a lower lip．Corolla：Vexillum，unguiculate，very broad，rather reflexed．Legume coriaceous，oblong－linear，com－ pressed，thickened at seminiferous suture，many－celled，biappendiculate at base．Wings oblong，shorter than vexillum，adhering to the keel beyond the middle．Ovarium many－ovulate．Style short，subulate，dilated into a capitate stigma．

3161．1553d．Comptosèma．Calyx bibracteate， 4 －cleft．Petals of Corolla equal，obtuse，on long claws ：Vexillum and Keel bicallous at base：Wings unicallous．Legume linear－oblong，many seeded．Vexillum ovate oblong：Keel of 2 nearly separate petals．

3153．Dactylocápnos thalictrifolia grows freely in any light rich earth，and grows well against a south wall，train ing it to a support．It is increased by seed．
3162. 1557a. Platystylis. Calyx campanulate, 5-cleft; the 2 upper lobes shortest. Style broad, spatulate, and villous at apex. Legume many-seeded. Seeds nearly globose.
3163. 1566a. Calycótome. Calyx bilabiate : Lips minutely toothed, short, deciduous, leaving a circumcised tube. Petals 4, free. Keel oblong, bluntly beaked. Glands of Stigma capitate. Legume oblong-linear, many-seeded, at length spongy. Endocarp coriaceous, separating from the epicarp.
3164. 1588a. Onobrychis. Calyx 5-cleft, nearly equal. Corolla with short wings and truncate keel. Legume of one compressed, indehiscent, echinated, crested or winged, l-seeded joint, which is thickest on the upper suture.
3165. 1588b, Oxyrámphis. Calyx bilabiate: Upper lip bidentate; lower tripartite. Petals of equal length. Vexillum acuminate, plicate. Keel beaked. Ovarium stipitate, compressed, elliptic-subrhomboid. Legume ovate, compressed, villous, 1 -seeded.
3166. 1588c. Amicia. Calyx campanulate, 5 -cleft: 2 upper lobes roundish, large; 2 lateral ones minute; the lowest one oblong, keeled, and concave. Corolla with an orbicular vexillum, and with the wings applied to the keet. Stamens monadelphous, with tube cleft in front. Legume linear, compressed, many-jointed : Joints truncate at both ends.
3167. 1591a. Cyclogyne. Calyx campanulate, with unequal segments. Vexillum emarginate. Wings short. Keel larger than wings, of 2 petals, which are connate at base. Ovarium villous, many-ovulate. Legume inflated, oblong, 1-celled.
3168. 1601a. Lénnea. Calyx campanulate, subbilabiate: Upper lip bidentate; lower one tridentate, Corolla: Vexillum obcordate, length of wings. Stamens monadelphous. Style filiform, with a pilose line. Stigma capitellate.

\section*{HEXANDRIA.}
[lobes, Bracts oblong entire, Racemes elongated, Spur longer than pedicels 19952 Stem simple furnished with leafy scales under the leaves, Leaves biternate with tripartite segments and oblong 19953 Stem a little branched, Leaves bipinnate glaucous, Lobes oblong-linear, Bracts ovate-pointed, Capsule linear torulose twice as long as pedicels
19954 Glab. glauc., Stems and brnchs twisted, Petioles ending in branched tendrils, Lvs tritern., Racs axil. or opp. the lvs on long peduncs, Fls abt 20 lge obl. fltsh yellsh with rubesc. mouth, Berrs obl. indehis. fleshy pale vi. 19955 Spurs 2 blunt ventricose short, Stems leafy, Segments of leaves obovate cuneated cut
[Leaves supradecomposed with linear lobes 19956 Pods globose hardly mucronate, Floriferous Pedicels erect longer than bracts, Racemes short, Stems erectish,

History, Use, Propagation, Culture,
3157. Wistaria is a genus of splendid, early-flowering, climbing woody plants. They like a light soil best, but will grow in any soil. They are quite hardy. If planted and trained against a south wall, or to the front of a house, it fowers in great profusion. They are increased by cuttings.
3158. Physalobbiun. Splendid climbers, requiring the same treatment as Hardenbergia. Like the species of all the' genera separated from Kennèdya, it is well fitted for training up rafters or trellis-work in a conservatory.
3159. Hardenbérgia is a genus separated from the old genus Kennèdya. Loam, peat, and sand are found to be the

20002 Wings of Corolla with one auricle each, Ovarium villous

\section*{\(\beta\) Flowers pure white}

and Miscellaneous Particulars.
best soil for the species. They require the same treatment as other twining greenhouse plants, by being trained up a raiter or on any convenient trellis-work.
3160. Zichya. Splendid greenhouse climbers, requiring the same culture and treatment as Hardenbérgia.
3161. Camptosema requires the same treatment as Hardenbergia.
3162. Plalystylis is a genus of elegant early-flowering plants, well adapted for the front of flower-borders. A light sandy soil suits them best, and they are readily increased by seed, or by dividing the plants at the root.

History，Use，Propagation，Culture，
20030．Cýlisus W＇eldèniz is now a common shrub in our gardens and pleasure－grounds．It has leaves as large as those of Labarnum，but the racemes of flowers are erect．
3163．Calycótome spindsa is a pretty shrub，and will be hardy in mild winters．It grows in any light rich soil，in an airy situation．It may be propagated by layers，but best by seed．

3164．Onobrỳchis requires the same treatment as the species of Hcdysarum．
3165．Oxyramphis macrostyla is a pretty greenhouse shrub，and is said to grow freely in a mixture of sandy loam and peat．it loses its leaves in winter．The flowers are half crimson and half rose－coloured，disposed in
[ed edges, Segments of caly \(x\) lanceolate elliptic bearded 20029 Slender brnchd, Leaves ovate-elliptic acuminate 3-nerved, Flowers capitate, Bracts orbicular acum, with beard\(\beta\) Leaves narrower

20030 Erect, Leaves ternate, Leaflets broad-elliptic entire obtuse glabrous, Racemes terminal pedunculate erect, Pedicels villous, Calyx 3-lobed ciliated, Keel villous, Legume glabrous
20031 Branches angular, Leaflets obovate-oblong, Legume glabrous

Con the ordinary Locust Tree
\(\boldsymbol{\gamma}\) This is a fine tree pretty common in our gardens. It has a dense umbrella-formed head. It is generally grafted 20032 Unarmed, Leaflets ovate roundish, Branches and Peduncles glabrous, the three lower teeth of Calyx acuminated, Flower large rose-coloured racemose
[bracteate at base
20033 Petioles spinescent, Leaflets \(4-5\) pairs oval obtuse apiculated silky, Peduncles 3-flowered, Calyx glabrous bi20034 Leaflets 2 pairs ovate acute glabrous, Stipules spinose
[gume inflated stipitate
20035 Hoary tomentose, Leaflets 5-8 pairs oblong or retuse, Racemes many-flowered, Calyx woolly bibracteate, Le20036 Suffruticose smooth, Leaflets 9-15 pairs linear-oblong retuse, Racemes few-flowered, Pedicels bractless, Calyx ciliately toothed, Standard yellow at base

20037 Herbaceous villous decumbent, Leaves opposite seldom alternate obovate-oblong, Stipules toothed, Peduncles few-flowered umbellate shorter than leaves, Segments of Calyx acuminate, Ovarium shaggy
20038 Leaflets 2-3 pairs ovate shiniug glabrous, Racemes erect few-flowered, Vexillum straight bluntish

20039 Erect glabrous, Leaflets oblong apiculated ciliated, Stipules adnate, Racemes terminal and lateral, Peduncles setose, Calyxes ciliated

20040 Stem erect hispid, Leaflets ovate obtuse mucronate hairy beneath, Spike long many-flowered, Wings of Corolla sagittate much shorter than calyx, Calyx and Legume villous

20041 Leaves trifoliate, Leaflets obovate retuse coriaceous mucronate silky villous beneath as are the branches, Racemes axillary, Legumes ovate compressed 1-seeded villous

20042 Leaflets 2 pairs cuneate obcordate truncately retuse, Legumes biarticulate
[dense, Calyx 5-toothed, Vexillum oblong, upper edge of Keel villous
20043 Glabrous glaucescent, Jeaflets \(2-6\) pairs ovate obtuse mucronate with a few peltate hairs beneath, Racemes 20044 Clthd with rufes. down, Lfts \(10-16\) prs oval ret. muc., Spks axil., Brcts and Stips lin. hisp., Teeth of Cal. ov. ac. 20045 Downy, Leaflets 18-22 pairs linear acute, Racemes axillary sessile, Calyx cup-shaped, Ovarium 7-orulate
[downy, Style glabrous, Stigma capitate 20046 Leaflets 9-10 pairs oblong obtuse downy, Racemes axillary horizontal many-flowered, Calyx bibracteolate
[ceolate sagittate, Bracts linear subulate 20047 Stem angular flexuous, Leaflets usually 5 pairs ovate-oblong rather retuse mucronate glaucescent, Stipules lan20048 Stem striated flexuous, Leaflets usually 5-8 pairs oblong downy mucronate 2-lobed, Stipules ovate-lanceolate acute serrated sagittate, Flowers crowded, Bracts subulate

20049 Clothed with white down, Stems numerous villous, Leaves pinnate, Leaflets \(13-15\) obovate-oblong smooth above and white from down beneath, Peduncles erect many-flowered, Flowers almost sessile
[of Cor. equal
20050 Flws in capi. heads ov. ses., Brcts imbri. tom., Cal. plumose \(5 \cdot\) cleft, Lvs woolly, Lfits 3 pairs oval awned, Segs 20051 Flws axil. ses. somewhat capit., Cal. 5 -cleft rather longer than cor. with woolly lobes, Lfls \(6-7\) pairs lanc. vil. 20052 Tomentose prostrate branched, Stipules concrete, Leaflets \(11-14\) pairs elliptic retuse, Peduncles racemose, Legume hairy

and Miscellaneous Particulars.
a short close raceme. The leaves are much like those of a species of Tephròsia,
3166. Amícia requires the culture and treatment of other hothouse climbing shrubs.
3167. Cyclógyne canéscens is a pretty greeuhouse plant. The flowers are numerous, purple, with a blotch of green in the centre. A rich loam and airy place in the greenhouse is said to suit it best.
3168. Lennea. This is a shrub with small impari-pinnate leaves, and clusters of pretty drooping flowers. It loses its leaves in winter, and grows well in the open air in summer; but, as it flowers in May or earlier, it can only be treated as a greenhouse plant.

History，Use，Propagation，Culture，
3169．Astartèa fascicularis is a very pretty greenhouse shrub，and differs principally from Melaleùca in the bundles of stamens being alternate with the petals，not opposite to them as in that genus；and in the flowers being pedicellate，

20053 Erect silky, Leaflets 3-5 obovate-oblong mucronate glandular beneath, Spikes ovate, Calyx downy with lanceolate pointed teeth
20054 Lfts obcord. or obl. ser. upper ones lanc., Stips subu., Racs loose, Pedicels half as long as calyx, Wings and Stand. equal longer than keel, Pods ov. obt. muc. rnded and slightly keeled on back, transvly. plic. rug. glab.
[Teeth elong., Wings shorter than obov. vexillum and longer than apiculated keel, Legume obl. 3_4-seeded
20055 Ascending, Leaflets rhomb-oval denticulate, Heads globose terminal, Flowers reflexed, Tube of Calyx short,
20056 Leaflets roundish spinosely denticulated, Stipules large membranous entire cuspidate, Heads round involucrated, Leaflets of Involucrum connate at base ovate-lanceolate acuminate with membranous edges

20057 Leaflets 7 pairs ovate or oblong mucronate, Stipules ovate, Umbels many-flowered capitate, Peduncles furnished with a simple or trifoliate bract just under the umbel, Teeth of Calyx very short
20058 Glabrous, Leaflets 4-5 pairs elliptic yellowish green membranous retusely emarginate at top, Racemes solitary, Teeth of Calyx puberulous on the margin

20059 Leaflets rhomb-obovate apiculate denticulated towards the top, Stipules pinnatifid, Peduncles usually 3-fiwd, Legume depressed biconvex of 5 circles veiny with smooth edges
3171. 1619c. Caióphora. Calyx 5-parted, with jagged segments. Petals 5, unguiculate. Scales 5, emarginate or 4-toothed at apex, each furnished with 4 sterile filaments inside. Stamens numerous, disposed in 5 bundles. Style trigonal. Stigmas 3, connivent. Capsule ovate-oblong, with elevated spiral ribs, and covered by the reflexed calyx, l-celled, many-seeded, opening at 3 of the sutures. Seeds angular, echinated.
3172. 1619d. Microspérma. Calyx with an ovate tube and a 5 -parted spreading limb. Petals 5 , spreading, obovate. Stamens numerous, in 5 bundles, joined with the bases of the petals. Ovarium free at top. Style filiform. Stigma 5 -furrowed, not divided. Capsule 1-celled, many-seeded. Receptacles 5, filiform, parallel. Seeds numerous, very minute, oval-oblong, angular.

\section*{POLYANDRIA.}
[Flowers spicate, Calyx glabrous
20060 Leaves alternate approximate subimbricate ovate-lanceolate acuminate broad at base sessile spreading at top, 20061 Leaves alternate terete stiff mucronate glabrous in udult state, Heads of Flowers small globose hairy the rachis villous, Bundles of Stamens 4-6-anthered with the claws equal in length to petals
20062 Leaves alternate coriaceous linear-oblong narrow at base veinless, Flowers ax llary dense quite glabrous, Bundles of Stamens 8-12-anthered a little longer than petals
20063 Branches twiggy glabrous, Leaves alternate linear acute glabrous distant recu ved at top, Bundles of Stamens few-anthered, having the claws length of petals
20064 Leaves opposite linear fleshy downy disposed in axillary fascicles when young, Flowers pedicellate axillary solitary

20065 Leaves elliptic ciliated rather hairy on the nerves

20066 Bundles of Stamens equal polyandrous, Leaves clavate downy
20067 Glabrous, Leaves opposite or subverticillate tern or quatern strict very long terete filiform mucronate, Flowers numerous unilateral tetramerous, Bundles of Stamens nearly equal 5-7-androus declinate pinnatifid

20068 Brnchs strag. rthr slen., Lvs oval ses. obt. ent. smth pale green small, Clusters of Fls short, Style very long
20069 Rameal Leaves imbricate linear-lanceolate keeled obtuse 3-nerved at base, Floral Leaves cordate-ovate 3 -nerved marginate, Bundles of Stamens hexandrous downy at base, Heads globose
20070 Leaves linear obtuse flat or lanceolate 3 -nerved marginate spreading pilose as are the branches, Bundles of Stamens 3-4-androus villous at base

and Miscellaneuus Particulars.
not adnate to the branches. The plant grows and flowers freely in equal parts of loam, peat, and sand; and ripened cuttings, not too old, strike root freely in saud under a bell-glass.

\section*{Page 660. Class XIX. - SYNGENESIA. Stamens 5. Anthers united by their edges.}

\section*{Order 1. ÆQUALIS. Florets of the disk and ray all hermaphrodite.}
3173. 1627a. Mulgedium. Heads many-flowered. Involucrum calyculately imbricate: outer scales much the shortest, imbricate. Receptacle naked foveolate. Achenia glabrous, compressed, often nerved, tapering above into a beak expanded into a cup-shaped ciliated disk. Pappus in one or few series. Bristles stiff, scabrous.
3174. 1650a. Achyrophorus. All as in Hypocheeris, except that the pappus is in one series and plumose.
3175. 1668a. Rhapónticum. Heads many-flowered equal. Scales of involucrum in many series adpressed, ending each in an entire or toothed acuminate or roundish appendage with scabrous margins. Receptacle beset with linear fimbrillæ. Corollas all 5-cleft, nearly regular. Filaments papillose. Anthers terminated by an appendage. Achenia oblong, compressed, glabrous, with an oblique basilar areola. Pappus rufescent, in many series. Bristles stiff, scabrous.
3176. 1702a. Ceràdia. Heads few-flowered, rayless. Receptacle flat, alveolate. Involucrum 5-leaved, naked at base. Florets of the ray female, with oblong terete downy achenia. Pappus in many series, setose, scabrous. Corollas filiform, truncate, shorter than styles; and branches of style linear obtuse. Florets of the disk male with short linear achenia, and smaller subdeciduous pappus. Corollas ventricose, 5 -toothed. Style filiform, truncate. Anthers mutic at base.
3177. 1706a. Barnadèzia. Heads many-flowered. Involucrum turbinate, of many series of imbricate scales: outer scales radiating. Paleæ of receptacle dense, hair-formed, twisted. Flowers all bilabiate. Anthers tailless. Achenia turbinate, villous. Pappus in one series, plumose.
3178. 1706b. Stifftia. Heads discous, many-and equal-flowered. Involucrum closely imbricate. Scales coriaceous, dry, many-nerved, ovate-rounded; inner ones linear Receptacle alveolate, naked. Corollas subcoriaceous, glatrous, regular, 5 -cleft, 10 -nerved. Lobes circinnately revolute. Filaments smooth. Anthers exserted, long-tailed. Style gla-

History, Use, Propagation, Culture,
20073. Symplocos japónica is much used by the Japanese for decorating the shrines of their idols. It is known in Japan by the name of iruroggi. When Thunberg first discovered the tree he took it for a myrtle, and Fortune for a holly.
20.075. Cùtus japónica is called Kum-quat by the Chinese; and the Kum-quat groves of the Island of Chusan are formed on the sides of hills in those situations where the tea plant (Thèa viridis) flourishes, and attain the height of 6 feet. The fruit ripens late in autumn, being then about the size of a gooseberry, of an oval form, having a sweet rind and a sharp acid pulp. It is largely used by the Chinese as a preserve, and very frequently finds its way to England as presents to those who have friends in China. Preserved in sugar according to the Chinese method, it is said

20071 Leaves oblong-cuneate toothed, Flowers solitary, Bundles of Stamens tetrandrous, Branches pilosarginate 20072 Lvs lin, quite ent. vil. when young but glab. in adult state, Floral ones naked at top, Flws at tops of branches among the ivs on short pedicels, Petals obl. obov. emarg., Sepals acum. hoary downy outside longer than petals
20073 Leaves obovate cuspidate green and shining bay-like, Flowers in axillary clusters
[very sapid, Rind brownish orange 20074 Shrub spiny, Leaves lanceolate tapering to both ends a little toothed, Petioles linear, Fruit compressed, Pulp 20075 Petioles winged, Stem angular, Flowers axillary solitary or twin, Fruit 9-celled

20076 Shrub spiny, Leaves emarginate oval-oblong nearly sessile quite entire obtuse with parallel veins, Flowers axillary fascicled or solitary

20077 Herbaceous, Leaves 4 in a whorl
20078 Stems erect or ascending terete, Leaves linear obtuse with revolute margins, Flowers cymose, Sepals rather unequal lanc. ac. with gland. serratures and num. black dots ben., Stams about 30, Styles half as'long as capsule
20079 Erect downy dichotomous beset with pungent bristles, Leaves rhomb-obovate or lanceolate acuminated lobed serrated, lower ones petiolate, upper ones ses., Racemes term. leafy, Petals bidentate and Cal. reflexed
20080 Hispid robust erect, Leaves impari-pinnate, Pinnæ 3 pairs oval ultimate ones confluent, Segments serrated, CaIyx campan. hispid, Petals white downy ending in 2 bristles at apex scaly boat-shaped white striped with red
20081 Bristly, Leaves opposite elongated pinnatifid, Lobes of Calyx pinnatifid, Appendages 2 clavate filiform at top of smaller petals, Styles 3 winged, Epigynous disk lobed, Fruit straight turbinate
20082 A beautiful garden hybrid with scarlet flower

20083 Leaves ovate acute lobed serrated, Peduncles elougated 1-flowercd, Flowers large, Petals acute, Stamens exceeding the petals
brous, bifid. Achenia glabrous, elongated, short-beaked. Pappus paleaceous, in many series, long, unequal. Paleæ linear, serrated.
3179. 1708a. Hebeclinium. Heads many-flowered. Involucrum campanulate: Scales in many series, subimbricate, often ending in a coloured appendage. Receptacle elevated, hairy. Achenia angular. Pappus in one series, scabrous.
3180. 1713a. Chabre'a. Involucrum campanulate: Scales in two series, oblong. Receptacle chaffless. Corollas all bilabiate, glabrous: Outer lobe of disk forets tridentate; inner lobe bipartite, with the lobes usually concrete : Outer lobe of ray florets strap-shaped, revolute, tridentate; inner lobe smaller, bipartite. Anthers bisetose at base and appendiculate at apex. Achenia ovate, cylindrical, beakless, papillosely setose. Pappus in one series. Paleæ concrete, combined into a ring at base, equal, subplumose.

Order 2. SUPERFLUA. Florets of the disk hermaphrodite, of the ray female.
3181. 1730a. Helépterum. All as in Helichrỳsum, except that the pappus is plumose.
3182. 1744a. Monolopia. Heads many-flowered. Florets of the ray ligulate, sometimes subbilabiate; those of the disk tubular, hispid. Scales of involucrum \(8-10\), in one series, concrete to the middle. Receptacle convex, chaffless. Anthers tailiess. Branches of the styles of ray forets terminated by a cone. Achenia glabrous.
3183. 1746it. Eurybbia. Heads many-flowered. Ray florets in one series, ligulate. Receptacle small, flat, or a little convex, alveolate. Involucrum imbricate with chartaceous scales. Stigmas of the ray florets elongated, erect, obtuse, scarcely hispid. Achenia obovate-oblong, cylindrical, striated, or angularly winged, glabrous or downy at top. Pappus in one series. Bristles scabrous.
3184. 1746b. Olecria. Heads many-flowered. Ray florets in one series, ligulate. Receptacle alveolate, flattish, seated on the top of a hollow obconical peduncle. Scales of involucrum at first adpressed, but at length spreading.

and Miscellaneous Particulars.
0 be excellent. Citrus deuicios \(a\) is nearly allied to Citrus nóbilis, the mandarin orange, with which it is cimfounded in Italian gardens. It differs from that kind of orange in the plant being spiny, in the leaves being a little toothed, and in the fruit being small, 2 inches in diameter, and by no red outside or inside, and has a very agreeable pulp.
3170. Severinia buxifolia is the small box-leaved orange. It is best propagated by grafing on the common orange.
3171. Caiophora is a genus of pretty twining annual plants, with beautiful reddish flowers. They require the reatment of Loasa or other tender annuals.
3172. Microspérma bartonioides only requires to \(b=\) treated like other tender annuals, by being raised on a hoted, and afterwards planted out in the open border.

Stigmas of disk florets shell-shaped. Achenia cylindrically tetragonal, villous. Pappus double: outer short, paleaceous; inner setose, long, and scabrous.

3185, 1746c. Macharanthèra. Heads radiate. Ligulæ female or neuter, linear, 3-nerved. Involucrum of many series, imbricate: Scales green with pale edges, spreading at top. Receptacle naked, alveolate, or fringed. Stigmas of the disk florets elongated at top, sterile. Anthers longer than corolla, mutic at base, and terminated by a cultriform appendage. Achenia compressed, hairy. Pappus pilose, equal.
3186. 1748a. Espaletia. Heads many-flowered, moncecious. Kay florets numerous ; Disk florets bisexual, or male only from abortion. Involucrum campanulate, imbricate, of many leaves. Receptacle flattish, paleaceous: Paleæ membranous. Anthers exserted. Styles of ray forets bifid, slender ; those of the disk florets simple. Achenia obovate, subangular, naked.
3187. 1749a. Swammerdamia. Heads many-flowered. Ray forets few, tridentate. Scales of involucrum imbricate, linear-oblong, obtuse, yellow, rather scabrous. Receptacle narrow, naked. Anthers of the disk florets tailed. Styles bifid, of the ray florets exserted; branches of those of the disk Horets deflexed, both capitellate. Achenia nearly terete. Pappus one series, hairy; the bristles rather clavate.
3I88. 1752a. Scho nia. Heads many-flowered. Florets all tubular; few in the circumference hermaphrodite, fertile; the rest central, male, sterile, with abortive styles. Involucrum cylindrical, of many series of scarious scales; outer scales shortest without any appendage, but the imner ones are furnished with a petaloid radiating appendage at top. Receptacle without paleæ, rather convex, alveolate. Corollas slender, 5-toothed. Styles in hermaphrodite florets bifid, swollen at base; in the male fiorets simple. Fertile achenia obovate, beakless, silky: Sterile ones filiform nearly naked, pilose at base. Pappus all similar, in one series, setose. Setæ serrated or subplumose.
3189. 1754c. Burrielia. Heads many-flowered. Ray florets ligulate, female, obovate; Disk ones tubular, 5-cleft, hermaphrodite, or sterile from abortion. Involucrum spreadingly campanulate. Scales oval acuminate, a little longer than the disk, in 1 or 2 series, equal. Receptacle without paleæ. Lobes of disk florets bearded outside. Achenia of the disk tetragonal, with 3-4-leaved pappus; and those of the ray obcompressed, bearing long 2-3-awned pappus.
3190. 1754d. Callichrda. Heads many-flowered. Scales of involucrum about 20, in two series; the outer series

History, Usc, Propagation, Culture,
3173. Mulgedium macrobizon grows well in a mixture of loam, peat, and sand; but should only be planted in vel dry situations, as the large fleshy roots are often destroyed by moisture in winter. It is an excelient plant for decori ting rockwork among autumnal flowers.
covering the achenia of the female florets. Ray florets ligulate. Achenia fusiform, compressed, truncate : those of the hermaphrodite forets downy, crowued by pappus; those of the female forets naked and glabrous. Bristles of pappus numerous, in one series, serrulately scabrous, persistent. Receptacle flat, downy, scaly on the margins.
3191. 1754e. Myriáctis. Heads many-flowered. Ray florets in 2-3 series, ligulate, entire Receptacle naked. Scales of involucrum in \(2-3\) series, linear, acute. Achenia compressed, flat, naked, glabrous, beakless, usually glanduliferous at apex.
3192. 1754 f. Hymenóxys. Heads many-flowered. Scales of involucrum in 2 series, rigid, adpressed; inner ones longest. Receptacle conical, alveolate from paleæ, and furnished with small glands. Styles truncate, bearded. Achenia uniform, turbinate, villous. Pappus paleaceous. Paleæ 5-8, unequal, membranous, oval-lanceolate, acuminate, erect.
3193. 1754g. Gynbxys. Heads many-flowered. Ray florets in one series ligulate, female; disk ones tubular, 5-toothed, hermaphrodite. Involucrum in one series, with a few bracts at its base. Receptacle flat, alveolate. Styles of hermaphrodite florets drawn out into a hispid acute cone. Achenia beakless, wingless terete. Pappus uniform, pilose, in many series.
3194. 1757a. Brachýcome. Heads many-flowered. Receptacle subconical, subalveolate, without paleæ. Involucrum campanulate, of a few series of scales. Scales membranous on the margins. Achenia compressed laterally, beakless. Pappus subsetiform, very short.

\section*{Order 3. FRUSTRANEA. Florets of the disk fertile, of the ray sterile.}
3195. 1800b. Echinàcea. Heads many-flowered. Ray florets neuter, long, ligulate, in one series; disk ones hermaphrodite, 5 -cleft, with scarcely any tube. Scales of involucrum in 3 series, lanceolate, ciliated. Receptacle ovate, paleaceous. Paleæ stiff, cartilaginous at top, exceeding the disk florets. Filaments rising from the base of corollas. Branches of stigma tipped by a semilanceolate appendage. Achenia tetragonal, obpyramidal, thick, crowned by irregularly jagged deciduous pappus.

\section*{EQUALIS.}

20084 Glab., Root thick, Stems prostrate, Lvs stern-clasping pin. pinnatifid sinuated or entire, Segms roundish toothd, Heads pedicellate subcorymb., Involucel twice shorter than involucrum, Scales of invol. blackish when dry

20085 Stem simp, corymb. at top hairy, Lvs persistent obl. acute, Petioles short shaggy winged, Cauline leaves stemclasping ovate acum. with small teeth in middle but entire at ends hairy, Peduncs and invol. setose
[thickish scaly, Invol. farinosely downy, Root thick 20086 Glab., Stems solid leafy, Lrs oblong toothed shining fleshy coriac., lower ones tapering to the base, Peduncs 20087 Leaves runcinate toothed or lyrate-runcinate, Cauline lvs sagittate entire or deeply toothed at base, Heads erect, Involucrum and peduncles hispid, Outer scales of involucrum lanceolate acuminate

20088 Leaves bipinnatifid with linear segments clothed with a few scattered hairs, Heads on long peduncles, Scales of involucrum keeled, Receptacle naked, Ray flowers usually three
20089 Stem herbaceous downy corymbose at top, Leaves pinnate lobed, Lobes ending each in a spiny mucrone, Root Heshy

20090 Lvs scabrous pinnatifid, segments lin.-acute a little toothed, cauline leaves decurrent, upper ones undivided, Heads globose corymbose, Outer scales of invul. rather tomentose lanc. acum., middle and inner ones ending in a scarious coloured jagged erect appendage
20091 Leaves pinnate, Lobes pinnatifid or coarsely toothed, Heads sessile
[bracts loosely spicate, Involucrum about G-flowered 20092 Root tuberous, Stems simple, Lvs remote dotted acum, ciliated at base, Heads in the axils of upper leaves or [much larger ovate acute 3-nerved coarsely serrated, Invol. usually 5-flowered, Pappus crown-formed toothid
20093 Erect downy, Branches corymbose, Lvs opposite sessile cuneate at base lanc. usually quite entire, lower ones 20094 Smoothish, Lrs ovate or ovate-lanc. 3-nerved coarsely and bluntly serrated, Corymbs densely capitate, Invol. clothed with clammy down, Awns of pappus three, two of which are subulate and the third very small

and Miscellaneous Particu'ars.

History, Use, Propagation, Culture,
3176. Ceràdia furcàta is very nearly allied to Kleinia, and the fleshy-stemmed kinds of Cacallia. It is said it yields a kind of gum-resin similar to Olibanum. It requires the treatment of other greenhouse succulents.
3177. Barnadexia rosea is a spiny shrub with simple leaves and heads of rose-coloured flowers similar to thnse of Mutisia. It requires a warm greenhouse, giving plenty of water in summer but sparingly in winter. Cuttings will strike root in the usual manner.
3178. Stifftia chryscintha. This is a beauciful shrub when in blossom, with its simple leaves and heads of orangecoloured flowers. Cultivated and treated like other stove plants; cuttings will strike root in the ordinary way.
3179. Hebeclinium iänthinum is similar to Agératum, and answers well if treated like the species of that genus.
3180. Chabra'a runcinata is a very pretty annual and may be grown in the open border. It is generally grown in pots like other tender annuals.

20095 Branches fleshy horned forked leafy at top, Lvs fascicled spatulate obtuse veinless glabrous, Peduncles solitary naked a little longer than leaves, Leaflets of invol. ovate with membranous edges
20096 Heads solitary ovate cylindrical downy sessile, Florets bilabiate, one lip oblong emarginate villous, the other filiform, Filameuts free, Hairs on receptacle twisted, Pappus stiff plumose
20097 Leaves broad-lanceolate, Flowers in heads indefinite

20098 Clothed with rusty down, Lvs large on long stalks rhomb-ovate cuneated at base quite entire scabrous above and hoary and downy beneath, Corymbs terminal compound many-headed, Achenia angular glabrous, Scales of invol. without appendages
20099 Beset with pilose glands, Cauline leaves pinnatifid white beneath, Lobes remotish oblong acute entire or somewhat pinnatifid, Heads ou long peduncles solitary, Invol. hemispheric with lanc. glandular scales, Achenia silky villous

\section*{SUPERFLUA.}

20114 Clothed with white tomentum, Lvs elliptic-lanc. on short petioles sinuately toothd glabrous above, Peduncles on short branchlets nearly terminal solitary or subcorymbose bracteolate, Achenia tubercularly dotted
20115 Whole plant covered with felt except on the upper sides of the leaves which is of a shining green, Heads large solitary axillary on long peduncles, Leaves oblong entire

and Miscellaneous Particulars.
3181. Helipter"um requires the same treatment as the Cape species of Helichrysum.
3182. Monolopia major is a rampant plant with dark green foliage growing in our gardens under the name of Helènium Douglasii. It flowers in great perfection during the summer months, which renders it worthy of a place in the garden. The plant is of easy culture.
20110. Grindèlia grandifiora comes nearest to \(G\). inuloides, and will grow well in the open border in summer, where it makes a showy appearance.
3183. Eurýbia is a genus of Australian shrubs separated from \(A^{\prime} s t \%^{\circ}\). They only require the treatment and culture of ordinary greenhouse shrubs.
3184. Olearia is similar to Eurÿbia, and the species require the same culture and treatment.

History, Use, Propagation, Culiure,
3185. Macharanthèra tanacetifolia is a pretty half-shrubby plant with ascending stems and purple flowers resem bling those of some species of \(A^{\prime}\) ster. It will flourish in the open air during summer. It may either be increased b! cuttings or by seed; the latter method is the best, as the plant is said to be a biennial.
3186. Espalètia argéntca is a pretty plant when in blossom. A light sandy peat soil suits it best. It should be kep in an airy part of a greenhouse.
3187. Swammerddmia requires the treatment and culture of any ordinary greenhouse plant.
3188. Scheenia oppositifolia comes very near to Hclichrỳsum, is equal in beauty to Rhodánthe Manglèsii, aur should be treated in the same manner. The ray and scales of involucrum are rose colour, and the centre yellow.
3189. Burrièlia grácilis is nearly allied to Lasthenia, but is readily distinguished from it by the different structur of the involucrum. The present plant is often cultivated in our gardens under the name of Lasthenia californica.

20116 Downy, Leaves alternate pinnatifid, Heads solitary, Ligulæ purple
[corymbose bracteate, Lvs long-lanc. with oblique nerves, Rays of heads hardly exceeding the involucrum 20117 Clothed with silky tomentum, Stem short thick leafy at length floriferous elongated nearly naked paniculately 20118 Clothed with rufescent wool, Radical leaves lanceolate lined beneath, Corymbs lonse simple, Ligulæ about 60
[petioles, Heads in panicles, Bristles of pappus like the antennæ of insects 20119 Branches angular, Leaves alternate obovate cuneate obtuse entire l-nerved coriaceous whitish beneath on short 20120 Lvs small roundish dull green above white beneath, Branches straggling bearing small clusters of white flowers
[radiating red, Bristles of Pappus stifish serrated 20121 Stem hairy canescent, Leaves opposite sessile lanceolate acute, Corymbs terminal, Scales of involucrum long

20122 Ligulæ and involucra 8-10-12, Leaves opposite lanceolate, Heads terminating the naked branches
20123 Very like Burrielia in habit, Leaves alternate sessile, Heads solitary pedunculate, Ray florets large cuneate
20124 Stem erect hairy from articulated pili and bristles, Leaves petiolate membranous coarsely-toothed, Scales of invol. 2-3 series linear-obloug ciliately fringed, Achenia glandular

20125 Plant erect slender, Lvs pinnatifid glabrous, Peduncles filiforin 1 -headed, Scales of pappus 5 unequal serrated
20126 Scandent glabrous, Leaves alternate on longish petioles ovate or ovate-lanc, acute rather fleshy eutire, Racemes corymbose terminal, Florets of the ray few, Bracts 4-6 spreading subulate
20127 Caulescent divaricately branched, Leaves entire ciliated, lower ones obovate, upper ones lanceolate, Scales of involucrum smooth so taper-pointed as to appear awned
[exceeding the leaves downy 20128 Stems many ascending, Leaves subradical thick obovate entire attenuate at base rather downy, Scapes much [of invol. obl. acutish membranous at apex, Achenia subterete clavate plicate at apex, Pappus almost wanting 20129 Glabrous, Stems erect branched, Lvs pinnate, Segms lin.-subulate distant quite entire, Peduncs l-headed, Scales \(\beta\) Flowers white very like those of the commou daisy
[ovate acute coarsely serrated, Ligulæ female, Outer leaves of involucrum linear spreading 20130 Stem quite smooth fistular, Leaves bipinnate glabrous, upper ones linear undivided, Rachis winged, Leaflets [Rachis of leaves downy beneath, Outer involucrum 5-leaved erect 20131 Stem almost wanting scaly glabrous l-headed, Leaves pinnate glabrous, Pinnæ serrated, upper ones decurrent 20132 Stem solid scabrous hairy much branched, Leaflets ovate deeply toothed unequal at base, Heads crowded, Peduncles slender glabrous at top
\(\beta\) Flowers resembling those of an Anemone
[entire, Paleæ bearded on back [cronately denticulate, Corymbs simple 5 headed, Invol. nearly glob. with ovate scales, Ligulæ \(5-6\) nearly 20133 Hoary toment., Stem shrubby erect branched, Lvs pinnate, Segms short imbricate approx, 3-lobed, Lobes mu-
[per undiv., Cory. comp. fastig. \(30-50\)-hdd, Sc. of invol. obov, obt. with membr. edg., Lig. \(5-6\) obov. glab. 20134 Stem shrub. erect nrly simp. white tom., Lvs nearly glab. pectinately pin., Segms distant nrly sessile tripar., up20135 Downy, Stems erect subangular or striated simple, Lvs pinnatifid rarely bipinnatifid, Rachis entire, Lbs lanc. obl. deeply ser. at apex, Corymbs compound fastig., Invol ov. obl. Ligula 5 obov. obt. hardly thd, Palez ac.

\section*{FRUSTRANEA.}

20136 Stem hispid, Radical leaves fiddle-shaped running along the petiole, Cauline leaves lanc. subserrated
20137 This is a very pretty garden hybrid
20138 Plant rather scabrous, Radical leaves fiddle-shaped subtrilobed subdentate, Cauline leaves ovate-lanceolate, Paleæ shorter than florets

\section*{and Miscellaneous Particulars.}
3190. Callichrda platyglóssa is nearly allied to Burrièlia and Lasthènia, and requires the same treatment.
3191. Myriâctis Gmelìni will require protection in severe weather. It should be treated like any ordinary herbaceous perennial.. Vegetable mould suits it best.
3192. Hymenóxys californica is nearly allied to Burrielia and Callichròa, and is treated in a similar manner.
3193. Gynóxys fragrans. A pretty climbing plant with a tuberous root and veryfragrant yellowish flowers. It is of easy culture and may be increased by cuttings.
3194. Brachycome iberidifolium is a most beautiful plant, the flowers exhibiting a variety of colours, as white, lilac, and dark purple. It flowers freely in the open border, and it has a very fine effect when grown in pots.
3195. Echinàcea. The species prefer a peat soil, otherwise they require the same treatment as ordinary perennial plants.

\section*{Page 748. CLass XX, - GYNANDRIA.}

\section*{Order 1. MONANDRIA. Stamens 1.}
3196. 2747 a. Physosiphon. Sepals combined into a ventricose tube, hispid at apex. Petals short, fleshy, in the bottom of the tube. Lip short, similar to petals. Column continuous with the ovarium short, mutic. Pollen masses 2, spherical. Habit of Pleurothállis.
3197. 1894a. Centranthèra. Lateral sepals connate : upper one galeate. Petals smaller, cuneiform. Lip 3-lobed, articulated with the column. Lateral lobes small, acute: middle lobe ovate-obtuse. Column winged, rather membranous, jagged at top. Anthers apiculated, 1-celled. Pollen masses 2, cohering.
3198. 1894b. Restrèphia. Sepals spreading: lateral ones under the lip, all connate. Petals filiform, with a triangular base. Lip free, similar, biauricular at base, or 2 -horned, spreading. Column short, semiterete, drawn out into a wing at apex. Anther 1-celled. Pollen masses 2, waxy, oblong.
3199. 1897a. Plëione. Lip undivided, broad, concave, having the disk crested, the margin fringed, and a free simple base. Column elongated, free, attenuated at base. Sepals and petals uniform. Pollen masses waxy, with a complete dissepiment.
3200. 1897b. Earina. Sepals erect, equal, acute, membranous, keeled. Petals fleshy, obtuse. Lip behind continuous with the column, fleshy, cucullate, 3-lobed, with a naked disk. Column short, terete. Anther 2-celled.
Pollen masses 4, cohering by pairs, collateral.
3201. 1897c. Trichósma. Sepals spreading, equal : lateral ones drawn out at base, and adnate to the foot of the column. Petals conform, erect. Lip 3-lobed, crested, cucullate, articulated with the foot of the columu. Column fleshy, marginate. Anther fleshy, arched, 2-celled. Valves vertical, with sphacelate margins. Pollen masses 8 , cohering by fours, two in each bundle smaller.
3202. 1908a. Epiphora. Sepals free, acute. Petals shorter, obovate. Lip behind articulate with the base of the column, which is much drawn out at base. Lip sigmoid, unguiculate, keeled, 3-lobed. Colamn and stigma vertical, with 3 tubercles. Anther 1-celled. Pollen masses 4, fixed to linear caudicula.
3:03. 1912a. Mycarânthes. Sepals conniving or spreading, equal or unequal, woolly outside: lateral ones unequal at base, adnate to the foot of the column. Petals smaller. Lip articulate with the foot of the column, 3-lobed, cucullate, with a crested or appendiculate disk. Column short, drawn out a long way at base, with a winged introflexed margin. Anther 2-celled. Pollen masses 8, ovate.
3204. 1900a. Ponèra. Sepals erect, fleshy: lateral ones larger, drawn out at base, combined with the elongated foot of the column; dorsal one flat. Petals oval, free, narrowed at base. Lip cuneate, 2-lobed, ascending, arched, articulated with the base of the column, naked. Column short, terete. Anther membranous, depressed, 4 -celled. Stigma roundish, excavated, 2 -lobed. Pollen masses 4, adbering by pairs.
320.5. 1907a. Eriópsis. Sepals and petals almost uniform, oblong-obtuse. Lip concave, 3-lobed, lamellate in the disk, drawn out at the base, articulated with the column. Column semiterete, clavate, wingless. Anther oblong, I-celled. Pollen masses 4, unequal, fixed by pairs to two elastic threads. Gland rather membranous, square.
3206. 1907b. Hexadésmia. Sepals connivent : upper one oblong-lanceolate; lateral ones triangular, united with the column into a kind of spur. Petals oblong, about equal to the sepals. Lip articulated with base of the column, nearly entire, plicate. Column semiterete, shorter than petals, clavate at top. Auther 6-celled. Pollen masses 6, equal, four behind and two in front.
3207. 1907c. Arpophýllum. Perigone spreading. Sepals connate at base. Petals much narrower. Lip articulated with the drawn-out base of the column, undivided, concave, shortly spurred. Column erect. Pollen masses 8 , pear-shaped, glutinous.
3208. 1907d. Otochilus. Sepals and petals similar. Lip 3-lobed : lateral lobes short, clasping the column; middle lobe elongated, spreading, crestless. Column elongated, semiterete, clavate. Anther 2 -celled, 2 -valved. Pollen masses incumbent, granular.
3209. 1907e. Barkèria. Sepals and petals equal, free, membranous, spreading. Lip flat, quite entire, naked, pressed to the coluinn. Column petaioid. Anthers 4 -celled, fleshy. Pollen masses 4, connate by pairs, on as mans reflexed stipulate caudiculæ. Flowers large, conspicuous, drooping.
3210. 1907f. Arundínia. Sepals linear-lanceolate, equal, spreading, connate a little at base. Petals conform, but broader. Lip convolute around the column, 3-lobed or entire, curled or lamellate in the middle. Column straight, parallel with the lip, semiterete, clavate. Anther 4 -celled, truncate, roundish. Pollen masses 8 , equal, cohering. Stigma arched, prominent, a little lobed.
3211. 2765a. Wárrea. Flowers subglobose, nearly regular, with a short rounded snout. Lip continuous, undivided, with fleshy elevated lines in centre. Column semiterete, clavate. Pollen masses 4 , inserted by pairs on a short linear caudicula. Gland triangular. Terrestrial.
3212. \(1911 a\). Spathoglóttis. Sepals spreading, free, equal. Petals a little broader, spreading, or connivent. Lip articulated with the base of the column usually saccate, tripartite, middle segment unguiculate, tuberculate at base, or crested, generally with one tooth on each side. Column winged, petaloid. Anther 2-celled. Pollen masses 8.
3213. 1911b. Schlímmia. Sepals fleshy, unequal: dorsal one linear, straight, free; lateral ones large, combined nto a sac at base. Petals equal to the dorsal sepal. Lip minute, with a fieshy claw, articulate with the column,

\section*{20139 Stem branched angular, Leaves hispid, Heads of Flowers with a dark centre}

20140 Stem branched angular hispid, Leaves petiolate acute tapering at base reticulately veined, lower ones ovate 7 -nerved crenately toothed, upper ones lanceolate scabroas obsoletely crenated, Stipules hispid on the back, Palea of receptacle pungent, Pappus very short nearly entire
20141 Glab., Lvs bipin., Lobes linear remote acute ent. or lobed, Outer Scales of Involuc ov. acum., Achenia rough mutic or 1-2-awned
[entire, Scales of Involuc. lanc. ac., Achenia glab. biaristate
20142 Stem glab., Lvs petiol. bipin., Lobes subapic. with scab. margins, Ray Florets lilac ov.-lanc. toothed at top or 20143 Stem downy, Leaves pinnate-parted hispid beneath with 2 pairs of lanceolateoblong subserrated leaflets, the terminal one the largest, Outer Scales of Involucrum lanceolate acute shorter, Achenia bi-triaristate
20144 White from tomentum, Lvs broad linear nearly sessile and stem-clasping entire or a little denticulated bearded at apex, Pappus double, Outer palea linear
23145 Stem branched furrowed, Leaves sessile glabrous pinnate, Lobes linear acute entire or a little toothed, Heads globose, Outer Scales of Involucrum drawn out ìnto an ovate pectinately ciliated scabrous appendage, middle bristle longer stiffer and shining

\section*{NECESSARIA.}

20146 Annual, Lvs ov.-lanc. coarsely toothed, Peduncs furnished with large setac, brcts, Scales of Invol. reflex. at top
tubercular. Limb simple, membranous. Column semiterete, auricled on both sides at apex. Pollen masses 2, waxy ; with an elongated cuneated caudicula, and a small lunate gland.
3214. 1911c. Ania. Sepals and petals linear-lanceolate, conniving, uniform. Lip connate with the base of the column, which is often drawn out into a spur or sac, 3-lobed, flat, bilamellate in the middle. Column erect, elongated, winged, Anther 6-8-celled. Pollen masses 8.
3215. 2772a. Dignàthe. Flower solitary, resupinate, fleshy. Sepals and petals spreading, equal. Lip flat, recurved, rather saccate at base, with two fleshy lamellæ adnate to the column. Column short, acute, rather conical, emarginate. Pollen masses 2, on a linear caudicula. Gland small, oval.
3216. 2772b. Pilúmna. Ovarium 3-ribbed. Sepals and petals equal, spreading, inserted obliquely. Lip adnate to column at base, nearly entire, unguiculate, convolute, inappendiculate. Column clavate, terete, surrounded by a membranous toothed hood at apex. Stigma vertical. Pollen masses 2, cleft behind, adnate to a short caudicula and ovate gland.
3217. 1902. Ornitharium. Flowers resupinate, closed, fleshy. Lateral sepals connate at base, parallel with the lip; the dorsal one separate. Petals conform. Lip free, unguiculate, fleshy, sagittate. Column semiterete, short. Stigma vertical. Pollen masses 2, on an obovate fleshy caudicula, with a triangalar gland, and reflexed beak.
3218. 1892a. Promine' \(a\). Sepals spreading. Lip 3 -lobed: middle one crested, or with many tubercles. Column short, semiterete. Gland ovate. Pollen masses 4, sessile by pairs. The rest as in Maxillaria.
3219. 1892b. Scuticaria. Flowers ringent, drawn into a roundish snout in front. Lip continuous, membranous, 3 -lobed, tuberculate in middle. Column semiterete, clavate. Pollen masses 4, inserted by pairs in a short linear caudicula. Gland triangular. The rest as in Maxilldria.
3220. 1892c. Paphínia. Flowers nearly regular, expanded, petaloid, rather drawn out into a snout. Lip small. unguiculate, tripartite, beset with filiform glands. Column clavate, elongated, semiterete, auricled at top. Pollen masses 4, fixed by pairs to an elongated caudicula, which is setaceous at top. Gland minute, rather triangular, Rostellum subulate. The rest as in Maxillaria.
3221. 1892d. Lycáste. Flowers ringent, drawn out into a short snout at base. Petals usually dissimilar. Lip furnished with an entire or emarginate, fleshy, transverse appendage in the middle. Column elongated, semiterete, usually pilose. Pollen masses 4, adnate by pairs to a narrow elongated caudicula, Gland small, roundish. Rostellum subulate. The rest as in Maxillaria.
3222. 1892e. Colax. Flowers subglobose, scarcely ringent, drawn out in a short snout. Sepals and petals nearly equal. Lip unguiculate, 3 -lobed, inappendiculate, flattish. Column rather elongated, semiterete, with a marginate clinandrium. Anther fleshy, crested. Pollen masses 4, collected into globose pairs, adnate to an obovate membranous caudicula. Gland none. Rostellum cleft.
3223. 1892f. Acineta. Perianth fleshy, spreading. Sepals connate at base: upper one ascending. Petals conform, a little smaller. Lip continuous with the column, very fleshy. Hypochilum oblong, concave. Epichilum scarcely articulated, tripartite, ascending, furnished with a fleshy appendage at base. Column erect, drawn out into a broad margin on both sides. Anther crestless, 2-celled. Pollen masses 2, sulcate behind. Caudicula linear. Gland lunate.
3224. 1892g. Aganisia. Perianth spreading, equal. Lateral sepals scarcely drawn out at base Lip free, movable, undivided. Hypochilum small, concave, separated from the epichilum by a transverse glandular crest. Column erect, semiterete, marginate, furnished with an acute spreading arm on each side. Anther crestless. Rostellum elongated. Pollen masses 4, combined by pairs to a linear caudicula. Gland small, oval.
3225. 1892h. Houlletia. Perianth spreading. Sepals nearly free. Petals a little smaller, unguiculate. Lip continuous with the base of the column. Column erect, arched, clavate, semiterete, a little shorter than lip. Auther bilocular, depressed. Pollen masses 2, cleft behind, fixed to a linear-lanceolate elongated caudicula. Gland acute.
3226. 2776a. Stenocóryne. Flowers ringent, closed, long-horned. Sepals much drawn out at base, and connate. Petals conform. Lip on a long claw, 3-lobed, with a callous disk. Pollen masses 4, connate by unequal pairs, semiglobose. Caudiculæ 2. Glands 2, oval.
3227. 2778a. Hélcia. Sepals and petals coriaceous, conform, spreading. Lip spreading, membranous, flat, contricted in middle; furnished with a fleshy, elevated, truncate appendage, which is foveate in middle, on both sides at base. Column free, terete. Clinandrium erect, fringed all round. Anther fleshy, 2-celled, drawn out into an obtuse solid pilea or cap. Pollen masses 2, excavated behind. Caudicula cuneated. Gland small, oval.
3228. 2778b. Trichoglóttis. Perianth spreading. Sepals equal : lateral ones under the lip. Petals a little smaller. Lip connate with the edges of the column, saccate, horned on the margius on both sides, with a fleshy undivided imb. Column erect, 1-horned at base. Anther 2-celled. Pollen masses 2, globose, 2-lobed ; with a linear caudicula aud a smali hooked or peltate gland.
3229. 2778c. Waitèsia. Sepals and petals equal, spreading: lateral ones rather oblique at base. Lip saddleshaped, parallel with the column, villous in middle, bidentate at base. Columnoshort, truncate, semi-cylindrical. Anther 2 -celled. Pollen masses 2 , globose, excavated on back; with two linear diverging caudiculæ counected by 2 ovate glands.
3230. 2782c. Dendrochilum. Perianth spreading. Sepals and petals similar. Lip 3-lobed, or auricled at base, bilineate. Appendages of column subulate.
3231. 2782d. Cleisomèria. Sepals keeled. Lip didymous. Lateral lobes erect, bifid: middle one concave bisetose at top. Caudicula cuneate, bifid, elongated.
3232. 2785a. Scelochìlus. Perianth conniving. Sepals narrow, navicular, keeled, cohering at base : lateral one under the lip and connate in one, and drawn out into a blunt spur at base. Petals broader, free. Lip entire, continuous above the base of the column, callous; and downy on disk, bicostate; bidentate in front; emarginate at apex. Column semiterete, naked, shorter than lip. Anther 2-celled. Pollen masses 2, spherical, solid with linear caudicula on a small obovate gland.
3233. 2786a. Clowèsia. Flowers subglobose, spreading. Petals nearly equal : lateral ones a little oblique, drawn out in a short snout, connate at base. Petals conform, but broader and fringed. Lip concave, fleshy, continuous with the column, not articulated, obsoletely 3-lobed, with a glandular jagged fringe on the margin, and a smooth disk. Column semiterete, clavate, obtuse, horned. Clinandrium tall, fleshy, serrated. Stigma transverse. Pollen masses 2, linear, furrowed on back. Caudicula membranous.
3234. 2790. Laca'na. Perianth fleshy, spreading, nearly equal, rather connate at base. Petals conform, but smaller. Lip articulated with column in middle. Hypochilum unguiculate, cuneate, 2-lobed, pulvinate at top. Epichilum entire. Column erect, semiterete. Pollea masses 2, cleft behind. Caudicula setaceous. Gland minute.
9235. 2790b. Odontoglóssum. Lateral sepals spreading, free Lip flat, unguiculate, ascending, having the limb reflexed, toothed, narrowed at top, concave at base, and furnished with a bilamellate rarely fringed crest, which is generally bidentate in front. Column elongated, auricled, or wingless at apex.
3236. 2793a. Anséllia. Sepals oblong, spreading, fleshy, free. Petals conform, straight, broader. Lip sessîle, spreading, 3-lobed, bilamellate. Middle lobe smaller and warted. Column elongated, marginate, auricled on both sides. Anther 2 -celled. Pollen masses 4, sessile, contiguous at base, the 2 dorsal ones much the smallest. Gland narrow, acuminated at both ends.
3237. \(2793 b\). Bromheädia. Perianth cylindrically conniving. Segments all linear-oblong, curved, channeled, bluntish. Lip cucullate, 3-lobed, nearly parallel with the column: middle segment retuse, yellowish, glandular, in disk; lateral segments ovate, shorter, violaceous. Column inarticulate at base, broadly winged, obtuse, fleshy. Anther 2-celled, dehiscing lengthwise. Pollen masses 2, reniform, excavated behind, sessile on a broad triangular gland.
3238. 2807a. Leochìlus. Sepals and petals spreading, lateral, connate. Lip undivided, tuberculate, or laminate at base, and furnished with melliferous hollow. Column short, terete, free. Anther broader than column, l-celled. Pollen masses 2, with a narrow elongated caudicula, on an ovate minute gland.
3239. 1897a. Acianthèra. Sepals conniving : lateral ones connate; upper ones galeate. Petals smaller, wedgeshaped, dilated at apex. Lip articulated with the column, 3 -lobed. Lateral lobes acute : middle lobe flat, obtuse Column winged, membranous, jagged at top. Anther apiculated, 1-celled. Pollen masses 2, cohering at base.

3240. 1916a. Telipд̀gon. Perigone spreading. Sepals narrow, acute. Petals broad-ovate. Lip similar, but larger. Column terete, pilose. Clinandrium furnished with subulate hooked processes behind. Anther 1-celled, 2 -valved. Pollen masses 4.
3241. 2817a. Arrhýnchium. Sepals and petals flat, free, equal atbase. Lip sessile, spurred, undivided. Column short, terete, hardly drawn out at base. Stigina circular. Anther roundish, 2-celled, membranous, depressed. Pollen masses 4 , by equal pairs; with a subulate caudicula, and a triangular, nearly free, membranous gland. Rostellum truncate.
3242. 2817b. Malachadinia. Flowers resupinate, lateral. Sepals connate at base, reflexed, and free at top, forming a galea: dorsal sepal cordate-acuminate. Petals small, scale-formed, roundish. Lip fleshy, with revolute edges, mucronate at base, articulated with the foot of the column, and adnate to the galeate lateral sepals. Column with 2 tendrils or horns in front, stretched out at base. Stigma liuear-oblong. Anther 2 -celled, deciduous. Pollen masses 2, waxy, sessile, with a soft naked gland.
3243. 1915b. Acribpsis. Perigone spreading, nearly equal. Sepals and petals similar. Lip connate with the base of the column, with a spreading, cordate, crested limb. Column erect, furnished on both sides with 2 horns, which are glandular at top. Anther 2-celled, hidden by the cucullate clinandrium. Pollen masses 2, fusiform; with a filiform caudicula, and a small subglobose gland.
3244. 1923a. Limatodes. Perianth erectly spreading. Sepals and petals nearly equal, free. Lip undivided, spurred at base, tumid inside. Column erect, semiterete. Anther 2-celled. Cells 4-valved. Pollen masses 8, obovate; with a short filiform caudicula and a minute gland.
3245. 1874a. Sarcoglóttis. This genus differs from Spiränthes, from which it has been separated by Presl, in the sepals being saccate at base, the upper one arched.
3246. 1861a. Peristylus. Perianth campanulate. Sepals and petals equal, similar. Lip entire, or tripartite, with a short bag-formed spur. Anther erect. Cells diverging. Beak flat, adnate to the anther. Pollen masses on 2 sublateral naked glands.
3247. 2838a. Physìrus. Perianth subringent. Sepals linear-lanceolate, spreading, upper one combined with the petals into an arch, which is tridentate at apex. Lip pendulous, narrowed at base, and drawn out into a short 2lobed spur at base. Anther acute, 2-celled.
3248. 2838b. Cheiróstylis. Perianth bilabiate. Sepals connate at base into a ventricose tube. Petals free, equal. Lip much larger, unguiculate, bicallous inside; with a dilated, deeply spreading, 2 -lobed limb. Column short, longbeaked, Beak emarginate. Anther intra-marginal, 2-celled. Cells 2-celled. Pollen masses 2, 2-lobed, with a common caudicula.

\section*{MONANDRIA.}
[acute, Lip linear obtuse fleshy with one furrow above 20147 Leaf spatulate marginate retuse shorter than racemes, Bracts small, Sepals acuminated, Petals linear-lanceolate 20148 Leaf obl. coriac. keeled subcord, at base, Petiole chan., Seps linear equal, lateral ones keeled, Petals linear obovate minutely serrated glabrous, Lip obovate fleshy with an inflexed tooth on both sides near the base
20149 Stems 2-edged, Leaf oblong cochleate fleshy proliferous double the length of the raceme, Bracts cuneate cuspidate cucullate shorter than pedics, Seps con., lat. ones semicon., Petals and lip same form, Clinand. toothed
20150 Leaf coriac. obl. sheathing the stem shorter than racs, Bracts ov., Seps coriac. obl. downy, lateral ones semicon., Petals short acute, Lip obl. hollow in middle bilamellate
[late ciliated, Lip ov. emarg. unguic. 20151 Lvs fleshy oval ac., Spike solit. pend. longer than lvs, Seps conniving ac., lateral ones connate, Petals subu* 20152 Leaf obov, emarg. much longer than stem and much shorter than loose erect raceme, Bracts small membran., Seps costate obl ac., lateral ones separate at apex, Petals lanc. ac., Lip linear obt. fleshy 1-furr. above
20153 Leaf obl.-lanc. emarg. coriac. longer than stem, Racs nutant many-flwd shorter than leaf, Seps lin.-lanc. acum. lateral ones conn., Petals conform much smaller serr., Lip tongue-shpd serrul. with marg. thick warted

20154 Leaf long lanceolate arched, Sheath close to the stem, Lip 3-lobed unguiculate, Lateral Segments short subfalcate acute, middle one obovate cuneated denticulated cleft, Lamellæ 2 fleshy
20155 Stem leafy, Leaves linear-lanceolate distich denticulately serrated, Racemes terminal few-flowered
[keeled ciliated lin, bifd, Petals ellipt. obt. cili, at top, Lip obov, obt. cili. 3-nerved, Top of Column ciliate 20156 Leaf narrow lanceolate obtuse about equal to the stem, Spikes secund fascicled not half so long as Ivs, Sepals 20157 Leaf roundish-ovate emarg. shorter than stem, Flowers fascicled, Sepals linear obtuse glabrous, lower one bipartite, Petals elliptic ac. ser., Lip ov. beaked concave at base cili. at top obt., Top of Column serrated
20158 Leaf coriaceous wavy emarginate narrow and channeled at base longer than stem, Spikes short fascicled, Flws glab., Seps and pets lin. acum., Lip lin. abruptly ac. a little constricted in mid., Col, cucul. winged subdentate
20159 Leaf narrow fleshy semiterete shorter than spike, Bracts memb. cucul. truncate, Flws drooping, Sepals roundish ovate free \(\mathbf{3}\)-nerved, Petals memb., Lip 3 -lobed fleshy concave, Middle Segment elongated acuminated
20160 Leaf lin.-obl. coriac. emarg, tapering into the charineled petiole longer than short stem, Raceme elong. manyflwd, Sepal equal ovate downy, Petals and Lip nearly equal truncate with glittering silvery particles at top
20161 Leaf obl. subspatulate retuse, Peduncles scaly longer than leaf, Spike nutant, Flowers sessile, Sepals 3 -nerved, Petals 3 linear smaller roundish-obovate obtuse equal to lip, Lip oval channeled at base bituberculate

History, Use, Propngation, Culture,
3199. Plëione is a genus of terrestrial Alpine Orchídece. Rich mould, mixed with pebbles or small stones, covered with moss and kept moderately moist, in beds raised with bricks, suits all the species well. P. Wallichiana covers the oak trees in its native place.
3200. Earina suaveolens is an epiphyte, and a native of New Zealand on trees.

20194 The blossom of this species is larger than any of the others
20195 Caudex creeping scaly, Pseudo-bulbs small obl. compressed smooth, Leaves 2 broad-lanc., Rac. tern. bract.
20196 Pseudo-bulb flask-shaped clouded, Bract hooded acute tapering to base, Sepals and petals linear-lanceolate 20197 Pacuminate, Lip rounded emarginate with 5 crested line
20197 Pseudso-bulb all same colour short thick rounded narrowed at base, Bract short inflated roundish hooded, Se20198 Pseudo-bulb ovate, Sepals and pip rounded emarginate with 7 crested lines

20199 Pseudo-bulb roundish, Lip crested by 5 lines, Perianth pink, Leaves elliptic-oblong acute nerved
20200 Pseudo-bulb ampullaceous, Sheath tubercul., Peduncs radic. sheathed at base, Lip 3-lobed sac. at base, middle lobe denticulated curled trunc. at top apiculated with \(4-5\) incomplete dentic. crests in disk, Col. that at top

20201 Spike oblong dense rather compound at base, Lip transverse rhomboid bicallous towards the base obsoletely 3-lobed, Middle segment roundish wavy emarginate, Leavts distich
20202 Stem 2-leaved covered with warted scales, Leaves rather fleshy petiolate, Spikes terminal spathaceous at base
[lose, upper one recurved obt. callous, lateral ones refracted, Petals linear, Lip ovate corrugated
20203 Pseudo-bulb ovate trigonal, Leaves oblong-lanceolate emarginate, Rachis linear-oblong crenated, Sepals piinside, Petals small acute glabrous, Lip ovate flack hairs, Seps acute, upper one smooth, lateral ones downy 20205 inside, Petals small acute glabrous, Lip ovate fleshy wrinkled
obt. callous on both sides at apex, outer lat. ones reflexed bident., inner ones or pets smaller subs of Perianth
20206 Pseudo-bulb lenticular 1-leaved shorter than erect racemes, Bracts ovate stem-clasping, Sepals linear-lanceolate acuminated, Petals subulate shorter than column, Lip linear-lanceolate acuminate villous bearded at top

History, Use, Propagation, Culture,
20225. Cirrhopétalum auràtum. This is the most interesting species of the genus. It hangs down from the branch of a tree or a piece of wood, which it soon overruns with its delicate green roots and egg-shaped furrowed pseudo-bulbs. The leaves are deep green above, and stained with purple beneath. The flower stems or scapes are slender and threadlike, and bear at top an umbel of flowers, which hang down gracefully and are balanced in the air. The flowers lave a yellowish ground, striped and mottled with crimson.

20224 Pseudo-bulb pyramidal truncate, Leaf ublong convex emarginate, Sheaths of scape oblong ventricose distant, Upper sepal ovate, lower ones very long perd. cil., Pets obl. cil., Lip obl. bicarinate, Auricles of col. setac.
20225 Pseudo-b. ovate sulcate, Leaf convex obl. purple beneath, Flws umbellate, Upper sepal and petals setaceously acuminated ciliated, lateral ones acute, Lip linear recurved, Auricles of column rounded entire
20226 Pseudo-b. ovate smooth, Leaf oblong acute tapering into petiole shorter than scape, Raceme scarcely umbelled loose, Seps. lanceolate acuminate, lateral ones very long, upper one acuminate incurved, Petals ovate acum., Column winged on both sides bidentate at top, Lip ovate acuminate fleshy recurved
20227 Pseudo-b.glomerate ov.-rndsh rather tetrag., Lvs usually 3 ov.-lanc. small ac., Scps rad. slend., Umb. many-flwd Lat. seps nar. ligu. ac. cohering, upper one and pets ov. acum. fringed, Lip small tongue-shaped thick naked 20228 Pseudo-b. tetrag., Leaf oblong obt. shorter than scape, Umbel dimidiate many-flwd, Dorsal sepal ovate, lateral ones linear-lanceolate, Petals ovate acuminate fringed, Lip ovate trisulcate bituberculate behind
20229 Pseudo-b. ov.-roundish rugose, Lvs ov.-obl. obt. thick, Scape terete elong., Umbel many-flwd nutant, Lat. seps very long ligu., Pets ov. ac. cil. at base, Lip tongue-shaped biaristate, Angles of column obsoletely bidentate
20230 Leaves lanceolate, Umbel many-flwd, Upper sepal galeate, Petals oblong obtuse serrulate apiculated, lateral ones lanceolate, Lip tongue-shaped obtuse fleshy
20231 Pseudo-b. obl. angular, Lf obl. convex emarg., Flws convolute, Upper sepal cil, set. acum., lat, ones obl, obt., Pets acum. cil. villous, Lip linear recurved elevated along the middle, Auricles of column obtuse entire
20232 Lvs lanceolate cleft at top length of erect scape, Racemes many-flwd pendulous, Bracts linear acuminated, Sep. glab., upper one acum., lateral ones linear ligulate hardly acute, Pets acuminate subciliate
20233 Pseudo-b. compressed one above another with a short 2-lvd neck, Lvs erect ensate, Rac. axil. 2-3-fiwd, Brets on peduncs many ov. acum. revolute, Seps and pets ov. ac., Lip 3-lobed trilamellate, Lobes ac., middle obl. larger
20234 Pseudo-b. short obl. usually 2-leaved, Lvs obl. undulated, Rac. erect, Bracts membranous coloured with revol edges, up. ones lin. refl., Lip 3-lbd with 2 short lamellæ and one long one, Mid. lobe of lip trunc. rugged apic.
2025 Stems compressed densely and loosely sheathed, Livs obl.-lanc. many nerved, Hacemes dense obl. drooping on short peduncles, Flowers subglobose downy, Lip subcordate-ovate acute without appendages
\(\beta\) Stems twice the size of those of species, Spikes on longer peduncs, Flwr closer glob. resembl. small cowrie shells
20236 Pseudo-b. oval compressed 3 -lvd, Lvs obl.-lanc, coriaceous smooth, Rac. toment, rad. sheathing at base, Lvs of scape or brets lanc. acum. apricot-sld, Lat. lobes of lip tooth-fmd, middle rhomb. curled with 5 straight lamellæ 20237 Pseudo-b, obl. 6mooth 2-4-leaved, Lvs obl., Bracts membranous obl. obt. reflexed, Rac. erect, Petals and sepals erect, Lip 3-lobed trilamellate at base, middle lobe roundish obt. 5-lamellate
20238 Stem elongated leafy, Lvs lanc. acute spreading striated, Spikes opposite the leaves many-flwd nutant, Bracts adpressed, Sepals and petals ovate acute erect smooth, Lip cordate-ovate acute bicarinate at base
20239 Stems fleshy rather flexuous terete, Lvs lanc. acum., Racemes opposite the leaves spreading many-flwd downy, Bracts ovate concave turned back, Lip narrow naked saccate at base, the middle segm. cuneate tridentate
\(\beta\) Spikes long, Flowers white
20240 Scems pend, densely clothed with decid. hairs, LVs lanc, coriaceous obt. entire densely vill. beneath, Rac. elong. many-flwd, Brets coriaceous persistent, Flws villous, Sepals lanceolate, lateral ones ending in a horn connate Petals shorter glabrous, Lip 3-lobed, middle lobe curled emarginate pilose
20241 Stems terete jointed sheathed, Lvs obl. obt., Rac, erect lateral many-flwd scaly at base, Bracts ov. acute ovary villous, Lat. lobes of lip erect trunc., middle lobe ov. serrated subplicate, Crests 4 -tthd, middle one fleshy
20242 Pseudo-bulb sheathed wrinkled 1-leaved, Leaf coriaceous lanc., Spike axillary few-flowered glabrous
20243 Lvs linear-lanceol. acum. glauc. beneath, Stems terete elong. pend., Racs term. aggregate cylind. many-flwd, Seps woolly ov. obt., Pets smaller spotted, Lip 3-1bd callous at base and apex, Lbs spottd, middle one trunc.
20244 Lvs coriaceous ovate or shortly cultrate obt., Flws sol. term., Lip linear-obl. emarginate without a crest ciliately toothed rather downy
sinuated horseshoe-formed line
20245 Lvs lanc. equal-sided approximate acute, Flower sol. axil., Lip cuneated elong. surrounded at apex with a thick 20246 Lvs lanc., Flws solitary axillary, Lip, emarg. curled at top with 2 obsolete lines running along the middle
[Pets obovate-oblong glabrous, Lip broad-oblong revolute villous in middle, the middle lobe roundish 20247 Pseudo-bulbs roundish compressed aggregate 1-lvd, Lf petiol. nutant downy, Peduncs bract., Brcts folia. concave, 20248 Lvs lin. obl. obt. recurved channeled, Panicle short strict spicate with clavate branches, Lip fleshy, middle lobe emarg, crenate, lat. ones short ac., Disk mealy convex at base
[L.at. lo'es short, middle one obt. undulated 20249 Pseudo-b. ov., Lvs obl.-lin, undulated shorter than the simple obt. raceme, Flws drooping, Lip 3-lobed downy, 20250 Pseudo-bulbs conical subcompressed annulate, Scape subclavate racemose at top, Sepals expanded emarginate, lateral ones large, Lip fiddle-shaped crenulated in the middle pulvinate dilated at apex and membranous
20251 Lvs 2 obl.-linear flat oblique at apex, Scape 2-edged terminated by yellow flowers streaked with red, Rac. term. 7 -8-flwd downy, Sepals lanceolate acute, upper one oblong linear concave spiculate, Pets a little shorter flat obovate obtuse, Lip bidentate bearded with long hairs
20252 Lvs broad-lin. fleshy channeled obliquely emarginate shorter than scape, Lat. seps keeled, Lip cuneate 5-lobed clothed with dense deciduous dowu similar to powder

20253 Stems pendulous, Lvs ovate-oblong obtuse nerved subcordate at base, Sepals lanceolate, Petals oblong acute, Lip downy convolute denticulate subunguiculate ovate obsoletely 3.lobed

and Misccllaneous Particulars.
3202. Epiphora. A curious little epiphyte, bearing yellow flowers streaked with red.
3203. Mycaranthes. A fleshy-leaved epiphyte covered with rusty down, with small white fowers
20253. Dendrobium macrophyllum is said to be one of the handsomest of the species. The flowers being 9 inches in circumference, of a bright rose colour, the lip deeply stained. D. cucumerinum is a curious little species, with the stems and branches resembling small cucumbers, and the flowers rather small of a dirty white streaked with pink.

- Flower larger, Lip with a large black spot in the middle
[joined with column into a spur
20270 Stems terete pendulous, Leaves oblong-lanceolate entire at apex, Racemes 3-4-flowered, Sepals lanceoIate, Petals larger oblong undulated obtuse, Lip obovate cucullate ciliated
20271 Stems terete pend., Lvs lin.-lanc. and oblong, Racs lateral loose 5-6-flwd, Bracts short, Seps spreading, Pets broader oblong obtuse reticul., Lip unguic. very blunt with abruptly inflexed fringed downy edges
[longer than sepals, Lip oblong curled at top and furnished with 3 elevated lines 20272 Leaves oblong obliquely-emarginate, Kacemes ohlong lateral, Sepals ovate bluntish, Petals linear contorted 20273 Leaves oval-oblong acute 7 -nerved, Racemes short many-flowered, Sepals ovate spreading broader than petals, Lip linear-spatulate acute beardless, Spur thick length of ovary
20274 Stems erect, Leaves oblong retuse, Racemes lateral terminal secund, Sepals ovate, lateral ones combined into an obtuse incurved horn, Lip entire acute tumid at apex
20275 Stems clav. artic. furrowed, Lvs lin, retuse, Pedunc. 2 -flwd, Seps oblong acutish undulated twisted, 2 lateral ones running into a retuse spur, Pets oblong, Lip large downy obovate shell-formed pulvinate inside at base 20276 Stems strong pendulous, Leaves ovate-oblong obtuse nerved subcordate at base, Sepals ovate-lanceolate, Petals oblong rather undulated, Lip roundish acute
20277 Pseudo-bulbs angular, Stems swelling at joints leafy towards the tops, Lvs obl. acute nerved, Racs lateral many-flwd, Bracts plicate, Seps ovate-oblong spreading rose-cld, Pets larger straw-cld ciliated, I.ip nearly square broad ciliated straw-cld with a deep yellow blotch
20278 Stem erect covered with black villi, Leaves linear acutely and obliquely 2-lobed, Peduncles 2-flowered, Sepals and petals acuminate recurved, Lip linear-lanceolate 3-lobed trilamellate, Lateral lobes short
20279 Lvs acuminate, Racemes nutant elongated many-flowered, Bracts minute obtuse, Flowers rather fleshy, Sepals roundish combined into a short horn at base, Pets broader entire, Lip cochleate obtuse villous fringed
20280 Stems erect fusiform, Leaves oblong emarginate distich, Racemes terminal many-flowered, Sepals and petals linear-obl. spreading curled, Lip crenulated, Lateral lobes acute, middle lobe lanceolate with 5 wavy lamellæ
20281 Pseudo-bulbs ovate lengthening into a neck 2-lvd at top, Lvs oval emarg., Peduncles terminal 2-3-flwd, Seps ovate emarg., Pets obovate apiculate, Lip 3 -lobed downy, Middie lobe with 3 elevated lines along the centre
20282 Stems erect Flowers twin nutant white, Lip blood-coloured, Bracts scale-like, Sepals linear-lanceolate, Petals oblong incurved broader, Lip roundish-obovate flat retuse apiculate entire
20283 Stem obovate compressed 2-6-leaved, Leaves oval acute striated dilated at base stem-clasping, Racemes about 4-flowered drooping, Sepals and petals ovate erect, Horn elongated obtuse, Lip cuneate smooth sulcate
20284 Stems terete erect, Flowers twin, Sepals and petals oblong obtuse fi:m, Lip oblong entire subsinuated obtuse plicately veined, Horn short obtuse
20295 Dwarfintric. tufted, Brachs short artic. cylind. 1-lvd, Lvs obl terete beset with rows of tubercs, Peduncs short 3flwd, Seps and pets lin. acum, obt., Lip 3 -lbd, lat. lbs triang., midd'e ones ov, curled with 4 wavy lamella in centre, Clinandrium denticulated [flwd peduncles, Seps and pets lanc., Lip short rhomb,-ovate
20286 Stem clavate short sulcate 3 -leaved at top, Leaves ovate-lanceolate obliquely emarginate shorter than 4-5-
20287 Stems slender, Racemes loose white with a deep yellow stain on the base of lip, Lip downy fringed near the base with long hairs furnished with a 3 -lobed tubercle, Flowers something like hawthorn
20288 Stems elongated 3 - 5 -leaved at top, Racemes erect elongated few-fiowered, Petals roundish twice as broad as seps, Lip 3 -lobed crested in middle bigibbous at base, Lobes roundish, Lateral seps drawn out into a spur

Histury, Use, Propagation, C'uliure,
3204. Ponèra. The species have the roots of Nebttia; the stems are tall, the leaves are grass-like, and the flower: are fascicled and buff-coloured. They are terrestrial plauts.

20289 Stems pend., Lvs lin.-lan. acute ent., Flws by threes, Seps and pets ov. obt., Lat. ones broadrst with a rounded horn, Lip unguic. ovate conc. apic, closely appressed to the column vill. inside glab. on the disk, Stigma vill. 20290 Roots villous, Stems elongated branched, Lvs ovate-oblong obtuse, Panicle racemose terminal many-f wd, Seps ovate acute, Pets and lip obl. undul. rounded emarg. with a 3-lobed yellow tubercle in the middle, Style vill. 20291 Pspudo-bulbs clavate many-ribbed 2-4-leaved, Leaves oblong horizontal, Racemes lateral loose slender arched Seps and pets flat oblong very blunt, Lip undivided cucul. roundish downy minutely pectinated and fringed
20292 Stems terete, Flowers loosely corymbose, Pedicels filiform giaucescent, Sepals linear-oblong, Petals broader ohovate, Lip 3-lobed, Lateral lones small acute, middle one linear-oblong villous at ba e pea-green
20293 Stems creeping, Leaves filiform terete, Leaflets of perianth loug linear narrower at top, Lip tricarinate, Middle lobe linear-lanceolate curled
20294 Leaves linear-lanceolate obliquely-emarginate, Spike about 2-flowered axillary on a leafless stem, Lip 2-lobed entire, Clinandrium furnished with a dorsal tooth
20295 Leaves linear-lanceolate obliquely-emarg., Spike about 2-ffwd terminal on a leafy stem, Lip acute crenulated and recurved at apex, Clinandrium mutic

20296 Stem erect compr., Lvs lin., Flws axill, and term. nutant, Seps lin.-lanc. spreading, Pets lin. converging, Lip 3-lobed, Middle lobe linear acuminate
[tuse with 3 elevated lines and 2 callosities 20297 Leaves long narrow distich recurved, Racemes short drooping nearly sessile, Lip tripartite, Mid. lube linear re20298 Leaves ovate obtuse, Peduncles 2-4-Howered sessile, Sepals and petals linear-oblong obtuse spreading, Lip repand a little lobed emarginate bicallous at base
20299 Stem branched, Flowers racemose, Ovaries subsecund pendulous much longer than setaceous bracts, Sepals lanceolate acuminated, Lip adnate 3-lobed bilamellate at base, Lateral segm triang, middle one lanc. elong.
20300 Leaves linear obtuse emarginate, Racemes terminal loose few-flowered, Sepals ovate-lanceolate, Petals linear spreading, Lip subcordate-ovate acute concave [tals linear-lanceolate, Lip 4-lobed, Lobes linear blunt 20301 Leaves distich lanceolate sheathed with warted sheaths, Flowers rather panicled, Sepals oblong concave, P'e20302 Stem clavate 2 -leaved, Leaves lanceolate, Raceme simple, Bracts ovate chanoeled, Sepals and petais lanceolate linear, Column clavate, Lip 3 -parted bicallous at base, Middle lobe unguiculate obtuse
20303 Stem branched sheathed by loose imbricate membranes, Leaf solitary falcate acute, Peduncles long, Sepals and petals linear-lanceolate, Lip 3-parted bituberculate at base, Middle Jobe linear-lanceolate
20304 Pseudo-bulb fusiform, Leaves oblong obtuse, Raceme radical panicled, Sepals lanceolate. Petals narrower, Lip tripartite, Middle lobe transverse 2-lobed or emarginate fringed
20305 Pseudo-bulb obovate 2-leaved, Leaves narrow oblong, Raceme terminal cylindrical, Flowers rising from scales Sepals linear, Petals linear-lanceolate acuminate, Lip oblong convex entire
20306 Pseuco-bulb ovate compressed ribbed 3-leaved, Leaves narrow elongated acute, Raceme dense many-flowered, Ovary 3-winged, Sepals linear, Petals lanceolate, Lip cochleate crenated curled
20307 Pseudo-bulb elong. ter., Lvs obl.-lanc. ac., Kacs short term., Seps and pets lanc. acum. reflxd, Lip ov. shell-frmo 20308 Leaves distich oblong-lanceolate, Raceme terminal, Sepals and petals nearly equal oblong acute concave spreading, Lip 4-lobed, Sepals keeled.
20309 Leaves long distich, Panicle nutant dense many-flowered rising from 2 spathes, Sepals oblong-lanceolate, Petals linear obtuse, Lip 3-lobed, Lateral lobes semicircular, middle lobe 2-lobed linear
20310 Stems erect simple, Leaves lanceolate acute subplicate, Racemes pedunculate cylindrical nutant, Sepals ovate, Petals setaceous, Lip subcucullate, Lateral lobes roundish, middle lobes ovate acuminate
20311 Leaves distich lanceolate, Racemes terminal and lateral many-flowered, Sepals ligulate obtuse, Petals linear cuneate mucronate, Lip 6 -lobed with 3 callosities at base
20312 Leaves distich lanceolate acuminate, Stem naked scaly, Racemes cylindrical many-flowered, Flowers drooping, Sepals linear-lanceolate, Petals ovate acute, Lip ovate acuminate entire crested at base
20313 Leaves narrow sub-distich keeled concave obtuse, Spike dense terminal, Bracts keeled distich, Sepals keeled, Petals linear spatulate, Lip roundish flat emarginate callous in centre
20314 Leaves distich elliptic-obtuse concave, Stems naked scaly, Sepals and petals Jinear-lanceolate, Lip 3-lobed, Lateral lobes jagged, middle one small truncate denticulate callous at base
20315 Leaves distich oblong, Sepals and petals lanceolate nearly equal, Lip 3-lobed keeled bituberculate at base, Lateral lobes jagged, middle one obcuneate truncate
20316 Leaves distich oblong obtuse with dotted edges, Stem simple leafless at top, Sepals and petals linear-lanceolate acute equal, Lip 3-lobed keeled, Lateral lobes rounded jazged, middle one cuneate curled triangular at top 20317 Leaves oblong-ligulate acuminate, Panicle large drooping, Sepals oblong-concave acute, Petals narrow linear, Lip 3-lobed 3-keeled, Middle lobe 3-lobed minute
[sulcate bicallous with involute edges 20318 Lvs distich obl.-lin. obt., Pedunc. sheathed, Flws panicled, Seps and pets lanc, obt., Lip :3-lobed, Midd]e lobe tri20319 Leaves coriaceous oblong acute, Peduncles slender subpanicled at top, Petals long filiform, Lip ovate toothed with 3 tubercles at base
20320 Pseudo-bulb ovate acuminate 2-leaved, Lws oblong-ligulate acute sheathing at base, Raceme erect manyflowered, Sepals and petals ovate-lanceolate acute, Lip linear callous and bifoveate at base
20321 Pseudo-bulb spherical, Scape panicled, Sepals and petals obovate-oblong, Lip free 3 -lobed cucullate, Middle lobe curied acuminate with an el, vated callous furrowed downy disk
20322 Pseudo-bulb oval compressed 2-leaved, Raceme narrow, Sepals and petals equal linear acuminate, Lip roundish 3 -lobed cordate, Middle lobe longer obscurely tridentate downy at base, Capsule 3-winged

20304. Evidéndrum Stamfordiànum is found on the coast of Guatemala in shady moist lands; the plant, therefore, will require an unusually moist atmosphere.

History, Use, Propagation, Culture,
3205. Eriópsis biloba has the habit of E'ria when not in flower. It has large plicate leaves. The history of its introduction is unknown.
3206. Hexadésmia. The flowers are those of \(A^{\prime} p o r u m\), and the structure of the pollen is that of Epidéndrum. The stems are erect and rise from rhizomata.

20323 Pseudo-b, compressed imbric. ov, ustrally 2-Ivd, Lvs ligu. obl. undul. rather oblique at apex, Rac. loose about 7 -flowered spathaceous at base longer than lvs, Seps and pets equal spreading oval-linear acute variegated with brown, Lip nearly free rhomboid acute deflexed on both sides
20324 Pseudo-bulb ovate compressed 2-3-keaved, Leaves linear-lanceolate, Scape flexuous many-flowered, Sepals lanceolate acute, Petals smaller subspatulate, Lip free 3-lobed, Middle lobe obl. cucul. with 3 crested callos.
20325 Glaucous, Pseudo-bulb oval compressed 1-leaved, Leaves ensiform, Scape pendulous panicled, Sepals and petals oval obtuse, Lip linear 3-lobed, Middle one oval callous in centre
20326 Pseudo-bulb ovate 2-leaved, Leaves linear-lanceolate obtuse mucronate, Scape many-flowered, Sepals and petals linear striated, Lip 3 -parted, Lateral segments inclosing the column, middle one long curled
20327 Leaves ligulate rounded and obscurely 2-lobed at top, Raceme panicled, Sepals and petals nearly equal lanceo-late-obovate, Lip 3-lobed free, Middle lobe ovate with elevated veins in centre
20328 Pseudo-bulb oblong 2-leaved, Leaves linear channeled acute, Kaceme simple, Sepals and petals linear-lanceolate equal acute, Lip 3-lobed, Middle lobe ovate-oblong, lateral ones linear
20329 Pseudo-bulb ovate corrugated many-leaved, Leaves ensiform, Raceme simple very long, Sepals oblong, Petals cuneate, Lip free 3-lobed, Middle lobe oblong obtuse curled
20330 Pseudo-bulb ovate-oblong 2-leaved, Leaves ensiform obtuse, Scape panicled tall many-flowered, Sepals and petals lin.-obt. spatulate uniform, Lip nearly orbicular 3-lobed keeled at base, Middle lobe broad lined wavy curled 20331 Pseudo-bulb roundish-ovate 2-leaved, Leaves oblong-linear scabrous as are the scape and petioles, Sepals and petals nearly equal obovate-lanceolate, Lip 3-lobed, Middle lobe emarginate bilamellate at base
20332 Pseudo-bulb year-shaped 3-leaved, Leaves linear acute keeled glaucescent, Scape erect simple many-flowered, Flws distant, Seps ovate-lanceolate acute, Pets narrower obt., Lip 3-parted, Middle segment obscurely 4-lobed
20333 Pseudo-bulb ovate wrinkled 2-leaved, Leaves linear-oblong bluntish, Sepals and petals obovate-lancalate incurved, Lip 3-lobed, Middle lobe large obcordate, Disk callous
\(\beta\) Lip rose-coloured
20334 Pseudo-bulb 3-leaved, Leaves lanceolate, Scape branched, Sepals oblong acute, Petals linear-lanceolate, Lip cuneate 3-lubed, Middle lobe large dilated subreniform furrowed biappendiculate in disk
20335 Ps.-b. tuftd ov. 2-3-lvd, Lvs lin. ribbd twisted, Rac. panicd term., Ovar. scab. from dots, Seps and pets equal spat. ac. spread., Lip 3 -lbd bical. at base, Lat. lbs short conniv. falc., mid. cord., Col. uncinly auric. at top
20336 Pseudo-bulb 2-lvd, Lvs ligul. acute, Scape simple slender, Seps and pets nearly equal cun.-lanc, varnished, Lip free unguic. 3 -lobed downy at base, Middle lobe renif. emarg. painted with tubercled and varicose veins
20337 Pseudoubulb obversely pear-shaped tufted 1-3-leaved, Lvs lin. acute recurved grassy, Spike term. loose-flwd, Bracts scale-formed, Seps and pets nearly equal lin.-obl. obt., Lip 3-lbd callous in middle, Middle lobe emarg.
20338 Pseudo-bulb ovate 2-leaved, Leaves ensate obtuse, Panicle loose, Sepals and petals uniform spatulate unguiculate obtuse, Lip 3-lobed free, Claw concave, Segments rounded
20339 Pseudo-bulb ovate smooth tufted 2-leaved, Leaves long linear obtuse, Panicle elongated loose slender, Sepals and pets lin.-spatul., Lip nearly free 3-lobed, Lat. lobes refixd, mid. one rounded entire undul., Disk bicost. 20340 Pseudo-bulb ovate 3-leaved, Scape terminal, Raceme many-flowered, Sepals broad-linear, Petals spatulate, Lip 3-lobed bilamellate, Middle segment roundish curled [tals lanc. ac., Lip 3-lobed, Middle lobe roundish
20341 Pseudo-bulb obversely pear-shaped aggregate 2 -leaved, Leaves lanceolate acute, Scape 2 -flwd, Sepals and pe20342 Pseudo-bulb ovate-oblong terete 2-leaved, Leaves ensiform, Raceme few-flowered, Bracts small, Sepals and petals obovate-lanceolate acuminate, Lip 3-lobed, Middle segment cordate plicate cuspidate
20343 Scape few-flowered, Flowers pendulous on long peduncles closed, Ovary fusiform large warted, Lip 3-lobed, Lateral lobes linear, middle lobe ovate with elevated veins
20344 Flowers densely racemose, Sepals oblong-lanceolate acute, Petals roundish unguiculate apiculate, Lip 3-lobed, Lateral lobes oblong truncate reflexed, Middle one longer curled rhomboid acuminate with replicate leaves
20345 Pseudo-bulb oblong-ovate wrinkled 2-leaved, Raceme radical many-flowered nutant, Lip hairy striated, Mid20346 Stem succulent leafy at top, Racemes radical many-flowered erect
[dle lobe small entire
20347 Stem fusiform, Lvs linear, Racs flexuous few-flowered, Bracts ovate membranous, Lip obovate deeply 2-lobed [2-horned on both sides 20348 Stems fusiform elongated, Lvs linear obliquely bidentate, Flws usually solitary, Lip ovate retuse subserrated 20349 Raceme many-fiwd, Bracts lin. acum. membranous, Lip 3-lobed, Lateral segm. roundish, middle one apiculate 20350 Stem fusiform compressed 2-leaved, Leaves linear emarginate, Flowers in fascicles of 2-4 rising from bracts, Lip plicate
20351 Stem slender with rough sheaths, Leaf solitary long curved, Spike dense, Flowers pink
20352 Pseudo-bulbs elongated fusiform, Leaves linear-lanceolate, Sepals and petals obtuse

20353 Stems fusiform, Leaves narrow, Peduncles slender racemose scaly terminal, Flowers drooping 20354 Stems 2 - 3 -leaved, Leaves oblong coriaceous, Raceme loose many-flowered terminal, Sepals lanceolate-acuminate, Petals ovate-oblong acuminate, Lip ovate subunguiculate lamellate in centre

3207. Arpophyllum is an epiphyte with pink flowers.
3208. Otochìlus. A curious little epiphyte from Nepal.
3209. Barkèria. Elegant Mexican plants, with much the habit of Catilèya. The flowers are large, elegant, and

History, Use, Propagation, čullure,
3210. Arundinia is a genus of splendid plants, having the appearance of reeds. The flowers are like those of Crifleya. The species are said to grow on rocks. Pot them in brown turfy peat, with the pot well drained, giving the plant plenty of water when growing freely. A. bambuscefolia grows in a forest of Chittagong on the face of inoist rocks.

20355 Leaves oval acute, Bracts linear, Lip oblong apiculated bicarinate unguic., Column clavate winged tridentate 20356 L®aves distich lanceolate-acuminate, Stem naked scaly, Raceme cylindrical many-flowered, Flowers drooping, Sepals linear-lanceolate, Petals oval acute, Lip ovate acuminate crested at base

20357 Caulescent, Leaves bifarious linear-lanceolate acuminate, Raceme terminal, Sepals linear-lanceolate, Petals obovate ventricose, Lip length of petals 3-lobed, Middle lobe more or less cloven
20358 Lip obovate rounded 4-lobed apiculated, Segments roundish, Lamellæ 3 equal curled straight, Petals oblong
20359 Pseudo-bulb oval compressed 1-leaved, Lvs ensiform flat longer than few-flwd spike, Bracts lin.-lanc. acura. chaffy, Flowers secund, Seps and pets linear-lanceolate, Lip tleshy dilated at top furrowed along the middle
\(\beta\) Sepals and petals brownish-yellow, Middle lobe of lip spotted
[2-lobed
20360 Bracts cucullate veiny leafy longer than ovary, Seps and pets ovate obtuse, Lip 3-lobed, Middle lobe sinaller 20361 Bracts short ovate, length of pedicel, Dorsal sepal linear-oblong, lateral ones acuminate, Petals falcate, Lip 3lobed, Lateral lobes falcate, middle one roundish curled emarginate

\section*{\(\beta\) Leaves narrower, Sepals ovate-oblong not obliquely cordate as in the species}
[Lip sessile roundish acute lobed on margin 20362 Leaves coriaceous flat obtuse oblong glaucous, Spathe 1-fowered, Sepals and petals linear-lanceolate obtuse, 20363 Lvs oval flat glauc. fleshy, Lip sess. cucul. cord subtrilobed edged with long hairs ard a large callosity on disk 20364 Lvs lin.-lanc. fleshy channeled, Seps and pets lin.-lan., Lip obcord. acum. veiny ser. at base on long ser. claw 20365 Lip oval or ovate acum, ciliately toothed sessile, Pets and seps lin.-lanc. acum., Clinandrum cucullate cut

History, Use, Propagation, Cullure,
3215. Dignàthe is a genus nearly allied to Aspasia. It is a small epiphytal plant, with scaly l-leaved pseudo-bulbs and green flowers spotted with yellow.
3216. Pilumna is a genus said to be closely allied to Aspasia. Its habit is that of Trichopilia. P. láxa has the sepals and petals of a pale watery green, tinged with purple; the lip cream-coloured, and rolled round the column, which is terete; a singular fringed hood overlying the authers (hence the name), and a nearly vertical stigma. They are pseudo-bulbous epiphytes, with coriaceous leaves and radical peduncles.

20424 Bluish, Leaves ovate-lanceolate acuminate spotted, Sepals and petals oblong obtuse, Lip 3-lobed, Lobes pllcately crenated at top, Lateral ones small roundish, middle one ovate obtuse, Spur straight obtuse
[tire, middle lobe crenated emarginate 20425 Pseudo-b. oblong 2-edged, Sepals linear-oblong acute, Petals obtuse concave, Iateral lobes of lip roundish en20426 Pseudo-b. oblong 2-edged, Sepals and petals linear obtuse spreading, Lip 3-lobed, Lateral lobes short, middle one fat nearly square wavy, Flowers solitary
20427 Pseudo-bulb scaly 1-leaved, Flower green, with a few yellow spots
[Sepals and petals linear-lanc., Lip oblong undivided roundish constricted in middle unilamellate in middle 20428 Pseudo-b, thin 2-edged 1-lvd, Leaf obl. spotted beneath, Raceme loose many-flwd, Bracts loose cucullate obtuse, 20429 Leaf broad-oblong, Raceme 2-3-Howered, Bracts lanceolate erect obtuse, Sepals and petals oblong-lanceolate acuminate, Lip oblong apiculated somewhat 3-lobed smooth
20430 Flowers sessile, Segments of Perianth oblong-obtuse, Lip 3-lobed, Middle lobe obtuse with a glandular disk Gland winkled setose at base
20431 Sepals and petals obtuse fleshy, yellow spotted inside, Lip oblong spongy white wrinkled rather scabrous

20432 Leaves ovate-oblong, Raceme corymbose few-flowered, Sepals and petals ovate acute, Lip repand acute, Wings of column short obtuse, Ovarium 6-ribbed
20433 Lvs roundish-oblong coriaceous, Raceme short corymbose, Ovarium 6-winged long-beaked, Lip ovate crested 20434 Pseudo.b. oval i-leaved, Leaf linear, Scape terminal many-bracteate at base 1 -flowered, Lip obovate acute naked gibbous at base, Wings of column fleshy blunt falcate

20435 Pseudo-bulb I-leaved, Leaves lanceolate acuminate at both ends, Petals and sepals linear-oblong bluntish flat, Lip 3-lobed, Middle lobe obovate acute inflexed unguiculate, lateral ones acuminate
20436 Leaves ovate-lanceolate, Petals linear-lanceolate, Lip 3-lobed, Middle lobe ovate concave, Lateral ones linearoblong reflexed hairy
[fleshy obl. ac., Lip 3-lobed, Middle lobe obl. spongy, Lat. segs triang. ascending acum, with 2 cili. warts 20437 Caulescent radicant, Lvs obl. fleshy oht. obliquely emarg., Ped short scaly 2 -flwd supra-axillary, Seps and pets 20438 Lvs distich coriac. rounded at top and obliquely 2 -lobed, Spikes dense conical, Dorsal seps and pets narrower lanc. ac., Lat. ones rounded at apex, Lip 3-1bd, Lat. segs ac., mid. one obl. obt. cornute and toothed in disk

20439 Subcaulescent, Pseudo-b. rather fusiform sulcate 2-lvd scaly at base, L.vs linear channeled convex on back, Peduncles scaly axil. 1-flwd, Perianth connivent, Seps and pets ovate, Lip undivided oblong obtuse
20440 Pseudo-bulb obovate angular 2-leaved, Leaves broad linear, Scape radical 1-2-flwd, Sepals and petals oblong acute, Lip oblong 3 -lobed, Lobes short involving the column, middle one acute reflexed
20441 Pseudo-bulb ovate compressed, Leaves lanceolate, Scape 1-flowered bracteate deflexed, Lateral lobes of lip oblong, middle one large much fringed ending in a saccate appendage, Spur short conical
20442 Pseudo-bulb ovate-roundish 2-edged tlattened 1-leaved, Leaves broad-lanceolate coriaceous obtuse, Scape radical short, Sepals and petals nar. lanceol. acuminate with revolute edges, Lip obovateroblong 3-lobed, Lateral lobes obtuse, middle one large revolute obtuse with dentately fringed edges and a pulvinate hairy disk
20443 Pseudo-b. oval flattened l-lvd, Lvs broad longer than scape which is clothed with scale-like sheaths, Bracts hooded longer than ovarium, Sepals ovate acuminate erect, Petals ensiform smaller, Lip oblong fleshy 3 lobed. Lateral lobes short, middle lobe elongated obtuse apiculated with a spatul. callosity in disk
20444 Pseudo-b. ellip. compr, wrinkled 1-lvd, Leaf lanc.-lingulate coriac. obscurely stri. tapering into the compres, petiole, Scape 1-flwd imbri, by bracts, Pets lin.-lanc., Lip 3-lo ed, Lat, lobes incurv., mid. one spread wavy
20445 Stem short scaly, Pseudo-bulb aggregate oblong furrowed 1-leaved, Leaf lanceolate, Scape 1-flowered, Petals and sepals erect oblong obtuse, Lip erect oblong obscurely 3 -lobed with a callous disk, Middle lobe rifid
20446 Pseudo-b. oblong compressed leafy, Lvs oblong wavy obtuse emarginate broadly sheathed, Scp erect 1 flwd loosely sheathed one half shorter than lvs, Seps and pets narrow triangular elongate, Lip obovate obtuse 3-lbd fleshy and curled at top with one tubercle above middle
20447 Pseudo.b. ov. tetrag. I-lvd, Lvs obl.-lanc. plic. Fls rad. sol., Seps obl. obt. spread., Pets sim. smaller, Lip fleshy ventric. 3 -lobed erect, Lat. lobes small ac., middle one convex outside with tabul. incumb. append. in disk
20448 Pseudo-b ov. obt. angular I-lvd, Lvs lanc., Petioles channeled, Rac. drooping length of radical Ivs, Lip cuneate 3-lobed, Lat. Iobes ac. crenulated in front, middle lobe 2-lobed cord. cucul. with 3-lbd blunt tubercle in disk 20449 Pseudo-b. ovate subtetrag, 1-lvd. Lvs lanc, acum. at both ends. Scpe 1-flwd with distant sheaths, Seps and pets obl. obt., Lip obl. 3-lobed without tubercles, Lateral segments small ac., middle ones elong. emarginate
20450 Pseudo-buib ovate-oblong compressed l-lvd longer than scales, Lvs linear-lanceolate acute recurved, Peduncs axillary solitary scaly at base, Flws drooping, Seps ovate-lanceolate revolute, Pets ovate obtuse connivent, Lip oblong undivided ovate arched reflexed at top contracted below the apex with an oblong callosity in disk

\section*{and Misccllaneous Particulars}
3217. Ornilhàrium striitulum is a caulescent plant with distich leaves and spikes of resupinate closed flowers, which are yellow and spotted inside; but the lip is white and dark purple at top. It is very nearly allied to Ornithochilus.
2774. Cirrha'a. The flowers of all the species have, for what is called the rostellum, a prolongation in the form of a tendril or cirrhus, hence the generic name.

History, Use, Propagation, Culture,
3218. Promine'a. A genus of pseudo-bulbous epiphytes separated from Maxillària, with 1-2-leaved bulbs and l-2-flowered-scapes and showy yellow flowers, often spotted or streaked with purple.
3219. Scuticarrin Steèlii is an old inhabitant of our stoves. It has an articulated branched bulbless rhizoma, fanshaped leaves, and large yellow flowers spotted with purple.
3220. Paphinia cristàta is a pseudo.bulbous epiphyte with few-flowered pendulous scapes and very pretty flowers, white outside and faced with purple inside, and the petals are altogether purple.
3221. Lycáste is a genus separated from the old Maxillaria, and consists of pseudo-bulbous epiphytes with plicate leaves, and erect, radical, one-flowered scapes. The flowers of all are showy, and propped by a large spathe-like bract.

20451 Pseudo b. obl. compr. 1-lvd, Lvs obl.-lanc. emarg., Rac. axil. densely aggre., Brcts cucul., Perianth bilab., Seps lin.-lanc. acum. keeled, Pets smaller, Lip obl, undiv. recurv, channelled at top with elev. transv. line in mid.
20452 Pseudo-b. cylind. elong. 2-lvd, Lvs lanc. 3 -ribbed, Scape erect with 2 sheaths, Rac. dense oblong, Brets setaceous, Seps and pets linear acuminate, Lip ovate-oblong fleshy lobed on both sides and warted on the face

20453 Pseudo-b. ovate tetrag. 2-lvd, Lvs thin lanc. spreading pale glaucous reticulated, Pedunc. diffuse 2-flwd, Seps and pets roundish-ovate acute spreading nearly equal, Lip oblong 3 -lobed, Lateral segms erect linear oblique obtuse, middle one ovate-oblong cucullate furnished with a fleshy flexuous transverse l-toothed crest
20454 Pseudo-b. oval tetrag. 1-2-lvd, Lvs narrow-lanc., Pedunc. ascend. 1-flwd terminated by a sterile pedicel, Brct ovate mucro. cucul., Seps and pets obl. ac. spread. nearly equal, Lip obl. 3-lobed, Lateral segms erect lin. middle obt. entire, middle one bilabiate, Upper lip fleshy short trunc. 5 -dentate, lower lip oblong acute
20455 Bracts broad-ovate acuminate, Middle lobe of lip ovate-oblong obtuse, Crest transverse furnished with a quadrate tridentate process, Anther incurved at apex.

20456 Plant rhizomatose, Rhizoma articulated branched bulbless, Lvs flagelliform, Flowers large yellow spotted with purple

20457 Plant pseudo-bulbous, Scapes pendulous few-flwd, Flwrs beautiful, white outside interruptedly banded with purple inside, Petals all purple

20458 Lip roundish spotted with crimson, Lateral lobes short, middle one [3.lohed, Column hairy, Petals naked 20459 Bract green cucul. acute length of ovary, Seps obl. wavy spreading recurved at top pilose inside at base, Pets erect longer than column oblong feshy recurved at top lobed towards the top, Lip shorter oblong concave 3-lobed, Middle lobe roundish crenated pilose with a tongue-shaped appendage, Anther villous
20460 Bract green about equal to oblong-lanceolate seps, Lateral seps falcate, Pets conform smaller, Lip lanceolate acuminate, Lateral segs acute, middle one ovate acum. serrated, Appendage fleshy emarginate
20461 Scape shorter than lvs, Sheaths ventricose acum., Seps obl.-lanc. spreading, Pets smaller obl. wavy connivent, Lip cucullate 3 -lobed recurved at top, Lat. segms roundish, middle one obl. obt., Callosity elevated ovate
20462 Bret green cucul. acute much longer than ovary, Seps obl-lanc. acute spread., Pets much shorter oval erect convol. above the column refiexed at top, Lip 3-lobed, Lat. lobes erect trunc., middle one longer ovate rounded deflexed, Appendages leshy tonque-shaped, Column downy, Flower 6 inches across
20463 Sheaths distant obt. cucul., Seps ovate-obl., Pets conform acute, Lip semicylınd., Lat. segms acuminate, middle one cuncate serrulate at apex, Appendage large concave fleshy truncate, Face of column villous
20464 Pedunc. rarely 2-fiwd, Sheaths distant obtuse cucul., Seps ovate-obt., Pets smaller conform, Lip shorter than seps concave 3-lobed, Lobes roundish, Middle one curled downy, Tubercle small flat, Column downy
20465 Bracts green shorter than ovary, Seps lanc., Lateral ones falcate, Pets conform but a little smatler, Lip oblong, Lateral segms small acute, middle one ovate obtuse fringed with a fleshy emarginate appendage
20466 Pseudo-bulb large ovate compressed, Lvs numerous oblong membranous nerved, Peduncs radical solitary l-fiwd, Seps oblong-ovate drawn out a little at base, Pets smaller broadish, Lip length of pets 3 -lobed with a bilamellate disk, Middle lobe oblong ovate incurved curled
20467 Upper bract cucullate, Seps oblong flat, Pets conform, Lip 3-lobed, Lateral lobes crenulated at apex, middle one rounded serrated, Column downy, Anthers villous, Tubercle of lip elevated slightly 3-lobed
20468 Seps and pets conniving oblong roundish obtuse nearly equal, Lip short 3-lobed, Middle lobe transversely rhomboid unguiculate flat
20469 Seps linear oblong obtuse with a series of spots along the middle, Pets narrower conform spotted, Lip narrow 3-lobed downy smcoth, Lateral segs short acute, middle one dilated rounded cuneate, Column lobed at top downy bisulcate towards the base
20470 Racemes erect, Hypochilum having a long blunt papillose horn
20471 Petals much smaller than seps, Lip 3-lobed, Middle segm, 2-lobed, lateral ones cuneated, Column short with broad wings, Callosity of lip linear simple, Raceme pendulous
\(\beta\) Flowers fulvous
20472 Pets equal with seps, Callosity of lip double, Lower one linear villous, upper one subhastate tridentate at top and many-dentate at base, Lip 3 -lobed, Middle segment emarginate, lateral ones scimitar-shaped, Column elongated with narrow wings, Scape pendulous

20473 Rhizoma creeping, Pseudo-b. small l-lvd, Leaf oblong 5-ribbed, Racemes erect radical shorter than leaves

and Miscellaneous Particulars.
3222. Cdlax is a genus of pseudo-bulbous epiphytes with terminal and radical plicate leaves. The peduncles are radical, erect, one-fiowered, and sheathed; and the flowers are greenish.
3223. Acineta. This genus is composed of subterrestrial pseudo-bulbs with much* the habit of Peristèria, with licate leaves and pendulous racemes of large yellow or purplish brown flowers.
3224. Aganisia. A pretty epiphyte with creeping pseudo bulbous rhizomes. The pseudo-bulbs are l-leaved, the capes are erect and radical, shorter than the leaves, which are plicate. The flowers are white with a yellow lip, aaving a blood-coloured spot at the base.

History, Use, Proparation, Culture,
3225. Houlletia is a genus of splendid epiphytes. The leaves are on long petioles and the flowers are in racemes.
3226. Stenocóryne longicórnis is a pseudo-bulbous epiphyte, with a solitary leaf to each bulb, and radical racemes of flowers, which are of an orange colour spotted with brown.
3227. Hélcia sanguinolénta is nearly related to Trichopilia and Aspasia, and its culture and treatment are the same ; but it differs in not having the lip united to the column, and in its deep-fringed anther bed.

20474 Lvs on long petioles, Raceme 6-fowered, Sepals oblong rounded at top as are the petals
[rounded at apex with lateral acute angles, Flwrs racemose yellow striped with chocolate colour 20475 Petals linear-lanceolate twisted at base, Lobes of hypochilum ovate obtuse straight, Epichilum rhomboid
[Lip large cucullate subrepand downy inside with a downy crest 20476 Lvs long terete pendent acute sulcate, Pedicels erect sheathed l-flwd, Seps oblong acuminate spreading uniform, 20477 Pseudo-b. tetrag., Leaf obl.-ac. plic. curled, Ped. 1-fld, Seps obl.-obt. with an elevated clav. horn, Pets conform wavy, Lip 3-lbd cucul. with rounded undu. subdent. edges, Mid. Ibe pilose, Callosity of disk fleshy cun. emarg.
20478 Pseudo-b, ovate obt. tetrag. 1-lvd, Lvs obl.-lanc. plicate, Racemes radical 3-flowered, Lip 3-lobed, Lateral lobes short diverging, middle one transverse a little 3-lobed revolute suberose, Callosity in disk tridentate in front 20479 Pseudo-b. ov, compressed tetrag. 1-lvd, Lvs obl.-lanc. 3-ribbed, Scape many-flwrd slender, Seps obl. ac., Pets lin. spatul. smaller, Lip obl. cucul. undivided undulated emarg. callous in the axis, Column downy
20480 Pseudo-b. rndsh-ov. ang. wrinkled l-lvd, Lvs obl.-lanc. rbbd ac., Scpe rad. many-fiwd, Flws on long peds, Seps lanc. acum., lat. ones reflexed at top, Pets lin.-lanc. stri., Lip ungui. 3-lbd stri. in mid., Mid. seg. lanc. acum.
20481 Pseudo-bulb ovate bluntly angular l-lvd, Lvs lanceolate, Racemes drooping, Lip cuneate 3-lobed, Lateral lobes acute crenulated with a blunt 3 -lobed tubercle in the disk and a downy claw

20482 Pseudo-bulb elongated tetragonal, Lvs oblong-lanceolate subplicate shining, Raceme lonse many-flwd, Lateral sepals ovate acute, Pets ovate acute, Lip unguiculate spatulate 3-lobed at top downy in middle with an elevated disk, Lobes rounded
20483 Pseudo-b. compr. roundish, Lvs obt. recursed coriac. shining, Scape filiform strict sheathed, Perianth bilab., Hind sepal arched, Pets obl. with revol. edges, Lip 3-lobed short cil. downg, Lateral lobes tooth-formed, mid. lobe revol. shining in cent. furnished with renif, callosity which is obsoletely triden. in front, Col. downy
20484 Lvs Lin--lanc., Sheaths acute, Seps obov., Pets obtuse, Lip tubercled on back, Anther glandularly pilose
[white dashed with pink, Lip large 2-lobed wavy curled white with rose-coloured blotches 20485 Pseudo-bulb slender obcordate, Peduncs \(2-\mathrm{fl}\) wd, Lvs broad-oblong coriaceous wavy, Pets linear not twisted 20486 Pseudo-b. narrow compressed furrowed, Lvs lanceolate flat slightly cordate, Pets twisted yellow, Lip even flat carmine with a white border

20487 Pseudo-b. ovate elongated, Lvs 4-6 inches wavy narrowed into a channeled petiole, Peduncs shorter than bulbs 1 -flwd bibracteate, Seps and pets olive spotted with blood colour, Lip white striped with blood colour obovate emarginate with yellow denticulated striated appendages
20488 Flws lateral usually solitary, Lip 3-lobed, Lateral lobes scimitar-shaped erect callous in middle, middle segment obovate denticulate with a villous keel, Column glabrous mutic running into the lip at base
20489 Caulescent, Lus distich coriaceous, Peduncles many-fowered lateral erect
[oblong apiculated smooth inside, Anther with an inflexed mucrone 20490 Spike elongated cylindrical, Bracts equal to ovarium, Seps narrow acute, Pets obovate-lanceolate broader, Lip 20491 Pseudo-b. ovate enclosed in a large membranous oblong pellucid striated sheath, Lvs twin broad-oblong plicate, Rac. elongated many-flwd, Seps and pets curved acuminate, Lip oblong-ovate acute
20492 Scape bluntly tetragonal sheathed in middle, Raceme elongated, Flws refracted after florescence, Bracts oblong green, Seps and pets ovate bluntish, Lip ovate acute naked marked with 5 marginal spots and 2 convergent convex lines in middle, Anther horned
20493 Rac. ascending 2 feet many-fwd, Lip 3-lobed bearded at base, Lateral segments erect triangular acuminate equal-sided, Middle lobe rhomb-lanceolate acuminate, Ovarium hairy
20494 Raceme very long many-Awd, Lip linear-lanceolate, Hypochilum lin., Metachilum horned at base pinnatifidly margined with terete bent glands
cesses, Column slender very long
20495 Rac. very long pendulous, Seps and pets membranac. recurved, Disk of lip roundish broken into clavate pru-
\(\beta\) Flowers pale green
[segments linear ascending, middle one hearded at base tongue-formed at apex 20496 Rac. loose, Brets subulate, Seps lio.-lanc. acute, Dorsal one refracted, Pets lin., Lip membr. hastate, Lateral 20497 Lvs coriaceous glaucous beneath, Rac. many-flwd pendulous, Ovarium tomentose, Seps oblong acute, Pers smaller lanceolate narrow at base, Lip flat 3-lobed tomentose in middle, Middle lobe thicker acute
20498 Rac. long pendulous compact, Seps lanc. flat, Pets similar rolled backward, Lip unguiculate ov. ac. with round disk the end of which is broken off into short curved processes forked at the point, Column length of lip
20499 Seps and pets lanceolate reflexed, Lip unguiculate, Hypochilum with an incurved horn, Metachilum 4-lobed

20500 Pseudo-b. ovate 2-1vd, Lvs oblong narrowed at base equal to raceme, Ovarium 6 -winged equal to striated oblong acute deciduous bracts, Lip saccate cordate dilated at top retuse with a tooth between bicallous inside, Column truncate denticulate with tooth-formed angles in front

and Miscellaneous Particulars.
3228. Trichoglóttrs pállens. A small epiphyte with yellowish green flowers spotted with brown.
3229. Wailesia picta is a pretty epiphyte with painted flowers.
3230. Dendrochilum. Small epiphytes of little beauty, with two-leaved bulbs, and racemes of flowers.

History, Use, Propagation, Cuiture,
3231. Clcisomèria. A small woolly epiphyte of little beauty

20501 Pseudo-b. conical, Scape fliform terminal elong., Rac. many-fiwd, Rachis flexuous angular, Brcts paleaceous convolute, Pets obovate, Lip cuneate-roundish auricled at base, Appendages of column subulate glabrous
20502 Leaves oblong-lanceolate coriaceous 3-nerved, Peduncs elongated with a long spike at top, Lip sinooth, Lobes linear-lanceolate acuminate ciliate, Segments shorter than the toothed columa

20503 Lvs broad bluntly 2-lobed, Racemes dense branched much longer than lvs, Bracts ovate concave reflexed, Rachis and ovaria woolly

20504 Seps and pets couniving, Lip fleshy galeate inflexed at base with an entire or serrate margin
20505 Seps and pets ov, conniving, Lip fleshy galeate roundish compressed apiculated undivided with serrate margin 20506 Lvs oblong-lanceolate many-plicate longer than compact raceme, Perianth spreading a little, Lip galeate incurved at apex with denticulated sides
20507 Spike elong. many-flwd, Perianth glohose, Seps and pets conform ov. ac. concave imbricate, Lip glob. denticu. 20508 Lvs very long grassy, Rac. cylind. pend. many-fiwd, Seps ovate-roundish conform to the pets, Lip urceol. truncate apiculate waxy inside, fringed on the margin
[roundish reflexed thick and denticulate
20509 Raceme decurved, Seps and pets spread. ovate acute, Lip fleshy cucul. with a thin pectinate margin, the apex 20510 Rac. large, Lip membr. inf. in front contract. at mouth the inner margin drawn out undu. and fringed-crested in disk, Pseudo-b. large ellipt., Lvs broad lanc. [dent. plate along the cent. which is \(2-1 \mathrm{bd}\) at base, Col . tendr. 20511 Lip lanc. sac. at base margins incurved at top and fringed towards the base, furnished with a fleshy ent. or
\(\beta\) Lip, column, and pets spotted with purplish brown
\(\gamma\) Lip ivory-coloured spotless like the column and petals
20512 Petals serrated towards the top, Lip saccate beneath the middle fringed with long succulent white slender hairs attenuated and recurved at top with a tripartite spine above at base, Spine large toothed
20513 Seps lanc. spread. dorsal one and pets arched, Lip rndsh abruptly acum. fringed sac. in middle, Col. cirrhate 20514 Spike short erect, Seps oblong-lanceolate complicate equal to lanceolate ascending pets, Lip hemispheric drawn out into an abrupt ovate fleshy blunt appendage at apex lacerated at base
20515 Seps and pets spread. oval fiat, Lip broad-ov. acum. obt. subcord, concave fringed smooth at top, Column short 20516 Pets linear-lanceolate same form as dorsal sep., Lip ovate-oblong obtuse saccate towards the base crenated and furnished above the sac with a large orange-coloured callosity, Column acuminate
20517 Lip beardless sagittately triangular, Angles roundish behind and toothed callous and dilated at top with the margin recurved and tuberculated at base
20518 Pets spotted linear-lanc., Lip subcordate ovate saccate towards the base furnished with a strong inflexed horn under the sac, Column cirrhate
[horn under the sac, Column cirrhate 20519 Pets spotted linear-lanceolate, Lip subcordate-ovate fringed saccate towards the base furnished with triparted 20520 Lvs. obl.-lanc., Perianth ovate compressed connivent, Seps and pets acum., Lip subconical cucullate contracted at mouth entire, Anther hemispherical compressed umbonate, Umbo bearing scales beneath
20521 Lip triangular very acute concavely hemispherical not ventricose, downy inside ciliated with long hairs on the margin at base
[tracted entire ciliated mouth
20522 Lvs oblong acute, Seps spreading, Pets ovate acute concave, Lip subconically saccate cucullate with a con20523 Raceme drooping many-fwd, Seps and pets linear acuminate, Lateral ones longer, Lip flat cordate membranous toothed or fringed saccate at base conical, Teeth of disk prominent
[Tendril short
20524 Seps and pets ovate secund, Lip cucullate entire smooth contracted into a short broad blunt fleshy beak at apex, 20525 Lip fleshy galeate resupinate rather compressed saccate behind entire and emarg. at top sharply denticulate at the sides, Tendrils hardly longer than column
20526 Racemes short dense pend., Seps and pets rndsh spreading incurved, Lip galeate compressed at base and ventri. at top with membr. fiat lobes, Lat. ones small and ser., middle one 2-lbd with divaric. fringed segs, Col. mutic
[lanceolate acute conniving, Lip 3-lobed, Lateral lobes acute, middle one elongate acuminate
\(20 \overline{27}\) Pseudo-b. turbinate, Lvs strict, Raceme nutant many-fiwd shorter than lvs, Seps and pets nearly equal ovate-
\(\beta\) Flowers yellow without any purple spots
20528 Pseudo-b. elong. terete articulate streaked 2-3-Ivd, Lvs lin.-lanc, acum., Raceme elong. many-fiwd, Seps and pets spread. unif. obl.-lanc. ac., Lip obl. narrowed at base unident. on both sides beneath mid. with refl. edges 20529 Rac. short erect, Seps and pets roundish-ov. ac. conc., Lip narrow cun. convex, Mid. seg. triang, acum, cucul. 20530 Lvs very long narrow glauc. beneath much longer than rac., Raceme obl., Seps ovate-lanc., Pets concave fleshy incurved with scarious edges, Lip concave slightly 3-lobed apiculate cucullate above the column
20531 Seps linear-oblong, Lateral ones reflexed, dorsal ones and pets oval-lanceolate erect, Lip unguiculate fleshy roundish cuneate apiculate emarginate on both sides with the edges turned over in form of a shell
20532 Seps and pets oblong. linear abruptly acute with reflexed edges, Lip linear incurved fleshy sparingly pilose with a short tooth towards the base on both sides, Back and margin of column downy
20533 Pseudo-b. obl., Lvs lanc. striated, Scape racemose, Flws remote pendulous dotted with brown, Seps refexed oblong acute with revolute edges, Pets same form, Lip obovate with revolute edges, Column twisted
20534 Raceme long many-flwd, Seps reflexed, Pets ascending lanceolate flat acute, Lip stalked fleshy elliptic with a distinct point rolled back on the sides scarcely angular
20535 Pseudo-bulb elongate articulate sheathed leafy at top, Peduncs taller than bulbs, Flws yellowish erect pedicel late, Seps and pets linear-lanceolate, Lip obovate apiculate entire, Column twisted
[obtuse striped with purple, Rhizoma tufted bulbless
20536 Lvs oblong coriaceous pale green twisted conduplicate acute recurved, Raceme radical branched, Pets obovate

and Miscellaneous Particulars.
3232. Scelochilus has much the structure of an Oncidium, with broad leaves and spikes of yellow flowers.

History, Use, Propagation, Culture,
3233. Clowersia is like Catasètum in habit, and requires the same culture and treatment.
2789. Anguloa is a genus of splendid epiphytes which will grow in a compost of peat and rotten wood, in baskets or pots, and they may be tied on blocks of wood.
2790. Peristeria is a splendid genus of pseudo-bulbous ppiphytes. They grow well in a mixture of turfy peat and rotten wood. They require plenty of pot-rnom, heat, and water.
3234. Laca'na is a pretty pseudo-bulbous epiphyte, and it may be grown in a basket or ticd to a block of wood and suspended to a rafter in a moist stove. It requires an ample supply of water and heat.

20537 Lip without any horns, Flws in pairs
[inside with 3 straight horns shorter than lip
20538 Ovary much longer than bracts, Pets fleshy oval convex obliquely ovate-acute, Hypochilum roundish glandular
20539 Bracts about equal to ovarium, Lip unguiculate with a roundish limb, Horns slender, Column winged
dentate, Column downy with margins a little dilated
20540 Lip constricted in middle, Hypochilum short sessile with cirrhose horns at top, Epichilum oblong-linear tri\(\beta\) Flowers white sputted with crimson
20541 Spike contracted, Bracts broad-obl., Lateral seps or.-obl., Hypochilum short saccate bidentate in front, Epichilum roundish-ovate entire longer than incurved horns, Wings of column hardly evident
[winged
20542 Brcts acum. shorter than ova. Hypoch. obl. sess, cleft, Epich. rndsh ov. ent., Horns falc, incurved, Col. broadly 20543 Hypoch. compressed sac. bident., Epich. roundish-ov, ent., Horns acum. incurved, Column with broad wings 20544 Lip a little contracted in mid., Hypoch. gibbous beneath gland. inside, Epich. 3-lobed, Middle lobe short, Horns lanc. incurved equal, Column glab. narrowly marginate
[Horns incurv., Column broadly winged 20545 Brcts acum. shorter than ovarium, Hypoch. open obov. sess. with inflexed tooth, Epich. roundish-ovate entire, 20546 Hypochilum subglobose gibbous in front equal to epichilum which is ovate entire or slightly tridentate, Horns falcate incurved equal, Column marginate
20547 Peduncs 1-fiwd, Bracts spathaceous imbricate, Pets ovate acute reflexed much shorter than the obtuse sepals, Column wingless cirrhate, Lateral horns of lip short fleshy
20548 Pseudo-bulb fleshy leafy, Scapes radical many-flwd erect shorter than leaves
[brown and a few large clear distinct blatches of the same colour on the seps, the lip itself is white \(\beta\) The ground colour of the fower except the lip is yellow, the column and pets are delicately streaked with rich 20549 Hypochilum convex longer than awns with the lateral horns papillæform, Epichilum acute triangular
\(\beta\) Flowers pale purplish, Lip white with a yellowish apex [nate, Psetrdo-b. furrowed, Lvs plicate petiolate 20550 Hypochilum convex having the lateral horns elongate and capitate with setaceous awns, Epichilum acumi\(\beta\) Flowers pure yellow
20551 Lateral seps roundish-obl. uppermost one obov. apiculated keeled, Pets small ov. ac. decurrent 5-nerved, Lip varnished, Hypochilum compressed in the middle 2-horned at apex, Epichilum ovate channeled
20552 Three exterior petals with reflexed margins, Lip about 7 -toothed at apex, Leaves ovate-lanceolate subplicate
[galeate rather quadrate and roundish, Lateral lobes minute, middle one truncate erect 20553 Hypochilum stipitate convex subcompressed tomentose at base, Mesochilum plicate and warted, Epichilum 20554 Pets approximate, Lip saccate with a large stalked galeate appendage, Column cidentate at base

\section*{\(\beta\) Flowers white}

20555 Leaves narrow lanceolate, Pseudo bulb ovate-conical deeply furrowed, Lip with 4 deflexed plicæ
[conniving into a globe, Lip 3-lobed, Lateral lobes obt., middle one pilose funnel-shaped bilabiate
20556 Peduncle 1-tiwd radical sheathed by imbricate inflated scales, Seps roundish apiculated and with the obtuse pts 20557 Pedunc. l-fwd radical loosely scaled, Flwr fleshy resupinate, Sepals and petals ovate convex conniving, Lip 3 lbd, Middle lobe pilose fummel-shaped bilabiate
\(\beta\) Flowers yellow ish, Middle lohe of lip orange-coloured
20558 Pedunc. 1-fiwd radical sheathed by 2 inflated scales, Flwr a little longer than spathe-like bract, Seps and pets acu-
\(\beta\) Flowers rose-coloured [minate, Lip glab. 3-lobed, Middle lobe narrow reflexed, lateral ones rounded
[Lobes obtuse 1-toothed on disk longer than column 20559 Scape erect tall, Raceme loose elongated, Epichilum roundish serrulated callous in middle, Hypochilum large, 20560 Scape short pendulous, Raceme dense, Epichilum roundish entire bilamellate above, Hypochilum elongated, Lobes roundish with a large lunate callosity in middle, Column 2 -horned, Rostellum truncate
20561 Raceme short dense pendulous, Epichilum rhomboid-oblong serrulated warted, Hypochilum short, Lobes acute, Column mutic, Rostellum short

20562 Habit of Peristerria, Racemes long drooping, Flowers pale yellow spotted with dark purple
[Pets obov. ac. a little undulate, Lip 3-Ibd, Lat, segm. triang., middle one obl., Wings of column jagged 20563 Pseudo-bulb oblong comp. 2-leaved, Lvs linear emarginate, Scape 2-edged, Raceme 6-7-flwd, Seps ovate acute, 20564 Like L. pulchélum but the flowers are smaller, the Lip is acute and excavated behind
20565 Pseudo-bulb roundish comp, smooth l-ivd, Leaf obl.-ligul. obt. shorter than rac., Seps and pets obl, obt. nearly equal, Lip unguic. renif. with 2 tubercs at base, Lat. wings of col, rather trunc., dors. ones roundish dentic. 20566 Pseudo-b. ov, tuftd 2-edged 1.Ivd, Lvs obl.-lanc. longer than radical 2-flwd scape, Bracts menib. keeled acum.,
Seps lin.-lanc. keeled acum. sprding, Pets obl. obt. rev., Lip roundsh ov. emarg, undul., Col. Wingless downy

3235. Odontoglossum is composed of pseudo-bulbous epiphytes, and forms three different sections or forms. In one the anther bed is surrounded by a deep fringe or membranous border. The other two are without any fringe; these form the subgenus Trymènium. In the second the lip is white, and generally broad and lat. In the third the lip is generally yellow, never white, and generally narrow. They will all grow among free turfy peat or rotten wood, or they may be tied to blocks of wood.

History, Use, Propagation, Culiure,
3236. Anséllia africàna. This plant was first discovered by Mr. Ausell growing on the oily palm, Elce is guincemsis, at Fernando Yo; but, although it is epiphyte in its native country, it will succeed very wely it all times.
turiy heath mould. It requires plenty of water while growing. A moist atmosphere is necessary at and
[Middle lobe oblong rounded, lateral ones erect subfalcate with 4 elevated lamellæ In middle 20596 Rac. long many-flwd, Bracts obl. scale-formed, Seps obl, obt., Pets similar acute narrower, Lip 3-lobed downy,
\(\beta\) Flowers yellow spotted with purple
20597 Stems tall terete leafy at top, Leaves plicate coriaceous, Panicles terminal
20598 Caulescent bulbless, Leaves distich oblong-linear emarginate, Spike terminal distich flexuous many-flowered on a long peduncle, Bracts short stiff tooth-formed
[upper ones scale-formed and green, Flowers sessile, Lip rhomboid-oblong glabrous
20599 Stem and plicate leaves covered with black pubescence, Leaves sessile oblong lanceolate acuminate, the 2 20600 Stem short, Leaves broad few terminal elliptic-ovate bluntish striated long-sheathed, Lower one the largest, upper ones bract-formed, Flowers large solitary sessile terminal, Petals and sepals equal conniving lanceolate, Lip obovate striated on disk wavy on margins elevated on disk, Column with short lateral lobes
20601 Lvs plicate ovate acuminate rayed, Flws large \(7-8 \mathrm{in}\). diam., Seps lanceolate spreading acuminate, Pets oblong,
\(\beta\) Flowers large deep rich crimson purple
[Lip emarginate flat smooth
[culate at apex fleshy on both sides at base with truncate emarginate inflexed teeth 20602 Pets trianqular, Lip 3-lobed, Lateral lobes truncate, intermediate lobe constricted in middle ovate and tuber20603 Lateral lobes of lip acute with 3 denticulated fleshy lamellæ
20604 Lateral lobes of lip rounded cuneated, middle one ovate rather scabrous with 2 lamellæ which are concave at base
20605 Leaves broad ensiform 5-nerved, Spike many-flowered, Lower flowers more remote, Bracts ovate acuminate shorter than the acute-angled ovary, Lip oblong 3-lobed, Segments roundish, Middle segment curled emarginate naked with many parallel elevated veins, Spur short
20606 Lvs lin.-lanc. much shorter than racemose scape, Bracts small subul., Seps lin.-spatul. obt. recurved, Pets a little broader, Lip 3-parted callous at base, Lateral lobes obtuse recurv., middle obcord., Spur cylind. obtuse 20607 Lvs obl. plic. acum. at both ends, Scape simp. rad., Seps lin.-lanc, acum., Pets similar wavy, Lip suborb. 3-lbd, Lat. Ibs nearly equal to the middle one which is short 2 -lbd with 2 short lam, at base, Spur round. infla. obt. 20608 Leaves strict ensiform plicate, Scape radical sheathed, Racemes capitate, Lip 3-lobed, Middle lobe longest bearded, Spur straight conical short, Bracts membranous veiny
20609 Stem simple, Lvs lanc. 3-nrvd, Corymb term., panic. nutant shorter than lvs, Peduncs sheathed with lin.-lanc. memb. scales, Seps and pets lin.obl. acutish, Lip large emarg. in front apicul. crenul., Spur equal to ovary
20610 Stem simple, Lvs lanc. 3-nerved, Racs sessile many-flwd, Lip ovate obtuse crenulated, Anther crested fleshy
20611 Sepals-and petals linear-lanceolate reflexed, Lip convolute with curled margins downy inside bicarinate at base, Spur acuminate horizontal, Anther furnished with an unguiculate rhomboid crest
20612 Leaves l nceolate striated, Scape very long, Faceme elongated loose simple, Sepals and petals linear-lanceolate, Lip stipitate oblong acute with 2 fleshy lamellæ at base, Middle lobe ovate wavy acuminate
20613 Leaves small grassy much shorter than 7 - 8 -flwd racemose scape, Lip roundish concave constricted in middle and lunate at top bituberculate in middle
[oblong obtuse villous with an emarginate callosity
20614 Leaves broader, Racemes equal or longer, Sepals oblong acuminate, Petals shorter narrower, Lip narrow 20615 Leaves obovate-oblong longer than 1 -flowered peduncles, Sepals and petals ovate-lanceolate conniving, lower ones larger, Lip cochleate roundish 2-lobed velvety, Crest arched crenated, Anther crestless
20616 Leaves broad-lanceolate spreading longer than few-flowered scape, Sepals and petals linear-lanceolate wavy acum., Lip roundish ovate with a lunate cren. callos. at base, Col. cucul. and toothed at top, Anth. rostrate
20617 Leaves ensiform shorter than raceme, Sepals and petals oblong acute, Lip roundish wavy narrow at base broadly 2-lobed downy with a crenulated undivided callosity
20618 Leaves broad-lanceolate, Bracts cucullate, Sepals and petals linear-lanceolate acute, Lip obovate emarginate. narrowed at base with villous veins and a narrow incurved emarginate callosity

20619 Stemless, Lvs embracing each other at base erect acute slightly plicate, Peduncles axillary l-fowered pendulous, Sepals and petals oblong obtuse curled at edge, Lip kidney-shaped emarginate, Column large fleshy
20620 Sepals roundish conc., Lip ovate convex retuse, Crest thick semicircular truncate plicate, Column naked at top
20621 Leaves lanceolate plicate, Sheaths large loose membranous, Sepals and petals undulated acute spotted, Lateral lobes of lip cuneate, middle one roundish papillose
20622 Raceme many-flowered, Bracts ovate-oblong membranous, Sepals and petals oblong bluntish, Lip sessile cor-date-roundish with thin plicate edge, Lat. lobes scimitar-shaped erect, Crest pulvinate with 5 series of warts

20623 Lvs linear ensiform twin equal to scape, Scape compressed closely sheathed, Racemes many-flowered, Bracts glumaceous yellowish, Flws nearly equal, Lip ses. ov. lanc. repandly curled downy at base inappendiculate
[obl. apic., Lip 3-lobed, Lobes roundish, middle one emarg. with a muc. and 3 undu. serru. lamellæ in disk 20624 Lvs broad-lanc. pli., Scape sheathed with lanc. distant bracts, Rac. dense bract., Seps spat. conc. reflxd, Pets

and Miscellaneous Particulars.
3237. Bromheádia palastris is an epiphyte of a peculiar habit. It will grow with the same culture and treatment as Ausíllia.

20625 Lve linear-lanceolate nerved, Scape simple, Sepals oblong-obtuse, Petals twice the size twisted at base, Middle lobe of lip roundish emarglnate, Spur short conical
[lobed, Petals linear straight acute
20626 Lip unguiculate ovate-rhomboid acuminate deflexed on both sides at base, Sepals revolute at top, lower one 2 20627 Lip rhom. keeled at base dwny as is the col., Lat. seps conn. at base, Racs longer than lvs, Lvs obl. wavy rather concave
[sides at back, Pets obov. mucron., Lip 3-lobed, Lat. Lobes triangular, middle ovate ciliated 20628 Leaf oblong emarginate longer that petiole, Flowers aggregate, Sepals keeled connate at top and free on both 20629 Leaf fleshy spatulate obtuse tridentate longer than 1 -flowered scape, Flowers bilabiate, Lateral sepals oblong acuminate, Petals truncate l-toothed beneath the middle, Lip ovate-oblong smooth with 2 elevated lines
20630 Leaves obovate-oblong narrowed into petioles, Scape angular l-flowered, Sepals ovate erect equal ending each in a long bristle, Petals truncate rather fleshy bluntly tridendate rhomboid serrulated

20631 Pseudo-bulb ovate elongated compressed 2-leaved, Leaves oblong-lanceolate undulated, Raceme long dense nutant, Sepals all free undulately curled as are the petals, Lip sigmoid lanceolate bicristate
20632 Pseudo-b, compressed oval, Lvs lanc, channeled acute, Rac. secund shorter than leaves, Upper sepal arched, lower one biden., Pets ov, obt., Lip eared near base bilam. in disk cun. and emarg. at top, Col. woolly at base
20633 Ps.-bulb oblong compressed leafy at base and apex, Scape many-flwd, Lip ovate reflexed bituberculate
[rium, Lip recurved obsoletely bicristate, Front sepal narrow cuneate bifid
20634 Pseudo-bulb 2-edged oval, Leaves linear-lanceolate acute, Racemes loose drooping, Bracts about equal to ova20635 Pseudo bulb compressed 2-edged oblong, Leaves linear-lanceolate smooth, Racemes drooping, Perianth wavy, Lower sepal formed of 2 , nearly bifid to the middle with spreading segments, Lip entire at top
20636 Column smooth, Lip in no degree hastate with many shallow ridges on each side near the base, Flow [arranged
20637 Lvs coriaceous keeled at top mucronate, Racemes dense pendulous, Lip obovate 2-lobed slightly hastate, Lamellæ of crest 3 on both sides, Col. downy with 2 minute subulate white wings and 2 oblong-linpar ones
20638 Leaves ovate-lanceolate rigid articulated to the petiole the rest without a petiole, Scapes bearing an umbel-like raceme of large drooping white flowers tinged with pink
20639 Raceme pendulous, Anterior sepal emarginate, upper one and petals ovate-oblong wavy denticulated lacerated towards the claw, Leaves linear-lanceolate
20640 Pseudo-bulb 1-lvd compressed, Leaf lanceolate wavy, Raceme 3-5-flowered, Sepals and petals conniving, Lip large 2 -lobed dilated with a downy lacerated appendage at base, Spur short conical

20641 Lvs sessile, Racemes pendulous loose few-fiwd, Lip roundish-oblong furnished with plates, Spur short subulate
[transverse emarg. narrower, Disk downy pulvinate, Stigma mutic, Wings of column semilunate entire 20642 Pseudo-b. roundish 2-edged compressed, Lvs oval apicul. fleshy, Pan. divaricate, Lip acuminate, Midule lobe 20643 Pseudo-b. cylindrical 1.leaved, Leaf lanc. nerved, Panicle simple many-fiwd subsecund, Seps 4 fasciate, Lower one spotted bidentate, Lip fiddle-shaped, Lateral lobes narrow, Crest 2 -horned, Wings of column lin. obt.
20644 Pseudo-bulb roundish compressed, Leaves Hat oblong lanceolate, Scape erect branched at top, Sepals all free, Lip 2-lobed roundish transverse, Lateral segments very short, Base of callosity 5 -lobed, Lateral lobes spreading flat truncate, middle one terete, Wings of column cuncate toothed reflexed
20645 Fseudo-b. terete 2 -leaved, Lvs broad ensiform, Flower stem partly climbing branched, each branch 4-6-flwd
20646 Elws panicled, Lateral sepals free obtuse, Lip roundish 2-lobed wavy auricled at base, Crest 5 -lobed tubercled, Wings of column small truncate, Anther downy
20647 Pseudo-bulb oblong furrowed l-leaved, Leaves oval acute sessile shorter than decumbent few-fiowered simple scape, Upper sepal as petals obovate concave wavy obtuse, lower ones smaller narrower and connate at base, Lat. lobes of lip linear, middle one obovate repand wavy, Crest warter, Wings of column linear obtuse
20648 Pseudo-bulb ovate compressed 1-leaved, Lvs complicate linear-oblong much shorter than erect flexuous fewflowered scape, Sepals lanceolate-oblong wavy obtuse, anterior one 2-lobed, Petals obovate and curled, Lip tripartite, segments obovate and sinuses broad and fringed, Crest 5 -horned, Wings of col. ovate acute
20649 Pseudu-bulb oblong compressed, Leaves ensiform stiff shorter than simple scape, Sepals and petals length of lip linear-oblong wavy, Lip cordate arched inwardly on both sides dilated and rather reniform at apex, Crest of 8 tubercles downy, Wings of column small, Stigma orbicular
20650 Leaves acutely triquetrous keeled subfalcate entire, Scape many-flowered drooping, Sepals boat-shaped acuminate, lateral ones connate, Petals ovate wavy acute, Lip 3-lobed, Lateral lobes roundish, middle one roundish sessile retuse or emarginate, Crest 5-lobed, Wings of column scimitar-shaped
20651 Lvs radical terete subu., Scape panicled stiff clammy, Seps and pets obov. acute conc. unguic., Lat, segs of lip obov., middle one renif, wavy emarg., Crest wavy truncate tuberc. at base, Wings of column small fleshy
20652 Pseudo-bulb subglobose 1-lvd, Leaf fleshy linear-oblong acute recurved, Panicle branched many-flwd, Sepals and petals linear obtuse, Lip 3-lobed, Lateral segments minute ear-formed, middle one unguiculate transverse emarginate, Crest 5 -lohed downy in centre, Wings of column deltoid straight
20653 Pseudo-bulb oblong compressed 1-2-leaved, Lis narrow oblong flat obtuse shorter than scape, Scape racemose, Sepals and petals spatulate retuse, Lip downy lunate pilose at base, Lateral segments small reflexed, Crest linear depressed at top bidentate on both sides the teeth bearing glands, Wings of column cuneate
20654 Leaves long terete keeled, Panicle contracted many-flwd, Seps and pets conform obov. concave, Lip elongated, Lat. segs linear, middle one unguicul. 2-1bd jagged on margin, Col. short downy with semiovate wings
20655 Panicle branched, Seps linear-lanceolate wavy acute, Lip triangular rounded behind acute at top, Crest manytubercled, Wings of column narrow subdentate drawn out at base
20656 Racemes subpanicled, Sepals linear acuminate recurved at top, lateral ones very long, Auricles of lip convex dilated crenated, Middle lobe unguic. crenated many-tubercled at base, Wings of col. semi-cord. acuminate

20657 Leaves 2 straight ensiform, Scape scandent racemosely panicled, Racemes flexuous, Lip 2-lobed roundish narrower at base auricled, Crest tubercled, Wings of column triangular acuminate
20658 Raceme twining panicled at base, Flowers few, Bracts oblong spathac. shorter than ovary, Lat. sepals unguic. connate at base lanc. wavy elong, dorsal one rndsh curled auricd at claw length of col., Pets lanc. revol. crid, Lip dagger-shpd crld with coarsely-toothed aurics and large 3-tongued crest, Wings of col. small setac.
20659 Ps.-b. 2-edged slender ribbed, Lvs ensate, Rac. simple, Seps and pets lanc. unguic. acum. wavy nearly eq., Lat. seg. of lip small obl., mid. one semicirc. flat emarg., Crest rhomb. cusp., Wings of col. short fleshy infiexed
20660 Ps.-b, oval compr. 2-lvd, Lvs nar. erect, Rac, droop. simp., Seps free, Pets lanc, wavy, Lat. lbs of lip small nrly square, mid. transv. hardly emarg., Tuber. obl. bident. at base obsol. 3-1bd at top. Wings of col. short rndsh
20661 Ps.-b. ov, flat. fur. 2-1vd, Lvs ellipt. rec. at top, Racs simp. erect or partly droop., Seps and pets obl. nearly eq. wvy, Lip obov. ret. with deprsd tubercs on both sides at base and thd lam. in mid., Wngs of col. slendr wvy
20662 Pseudo-b. flattened obl. L-lvd, Lvs obl., Scape racem., Seps ov. ac. free, Pets conform broader, Lp large 3-lbd rndsh emarg. apicul., Lat. lobes small obt., Crest 3 -lobed warted, Wings of col. semicord. crenul. spotted
20663 Lvs terete 3 feet long diffuse, Scape erect densely panicled, Sepals and petals obtuse apiculate concave, Lateral lobes of lip spreading obliquely oblong nearly square, middle one obovate bifid with a depressed tubercle at base and 3 -horned at top glabrous, Wings of column sablunate short rounded
20664 Lvs equit. ac., Scpe long pend. panic., Seps lin. acum., lat. ones almst conn. to apex, Pets obov. rndsh-apic., Lat. lbs of lip short conv. obt., mid. one ung. renif. emarg., Tuberc. on crest \(2-3\)-lbd, Wings of col. large rounded 20565 Lps short ensiform obtuse, Panicle spreading, Seps ov. acute flat free, Pets conform rather wavy, Lip 3-lobed, Lat. lobes rounded curled downy at base, mid. lobe 2-lobed, Crest flat rather 4 -lobed at top, Coll. wingless
20666 Panicle racemose, Sepals free obovate, Petals larger unguic, obov.-spat., Lateral lobes of lip short serrulated, middle one large wavy emarginate, Crest linear 2 -lobed, Column with fleshy truncate glabrous wings
20667 Pseudo-bulb oblong sub-tetragonal 2-leaved, Leaves stiff spatulate-lanceolate, Scape slender pyramidal almost simple racemose. Flowers distant, Petals and sepals acute reflexed, Lip large roundish obsoletely 4-lobed, Crest triden. arched behind cuneate in front with varicose veins, Upper wings of col. rounded denticulate
20668 Pseudo-bulb oval slender, Leaves membranous ovate-lanceolate flat, Panicle racemose, Bracts 3-4-flowered, Middle lobe of lip roundish 2-lobed, Tubercle of crest 5-7-toothed glab., Wings of column triangular
20669 Pseudo-bulb oval shining 2-edged 2-3-leaved, Leaves lanceolate erect recurved at top, Scape panicled, Flowers secund, Sepals and petals lanceolate wavy equal free spotted, Lip 3-lobed, Lateral lobes roundish, middle one unguiculate transverse 2-lobed, Crest linear tridentate at top bidentate in middle, Wings of col, trunc.
20670 Bracts ovate membranous obtuse, Lateral lobes of lip short, middle one large transverse emarginate obcordate, Crest bicallous, Tubercles distant one placed in front of the other, Auricles of col. linear falcately recurved
20671 Leaves coriaceous acutely triquetrous complicate keeled, Scape panicled many-flowered, Sepals 2 spatulate, Petals ovate unguiculate wavy, Lateral lobes of lip small linear obovate, middle one reniformly lunate emarginate, Crest double, upper 5-lobed, lower 3-lobed, Wings of column crenulated
20672 Pseudo-bulb oval flattened 3-ribbed on both sides l-leaved, Leaf oblong sessile striated, Panicle divaricate, Lateral sepals connate at base ovate acute as are the petals, Lip large 2 -lobed, Crest tubercled hastate 3-parted, Wings of column rounded toothed
20673 Pseudo-bulb ovate 2-leaved, Leaves ensiform recurved, Scape panicled, Sepals linear-oblong wavy reflexed, Lip fiddleshaped, Lateral lobes acute, middle one 2-lobed, Crest of 5 crenated lamellæ rostrate at top, Wings of column cuneated tonthed, Stigma beaked
20674 Pseudo-bulb oblong fattened furrowed 1-2leaved, Leaves oblong-lanc. coriaceous shining, Flws panicd, Seps green lanc., lower ones conn., Pets obov. spat., Lip 3-lbd with elong. horn in centre, Col. elong. wingless
20675 Pseudo-bulb ovate-flattened furrowed 2 -leaved, Leaves linear-lanceolate, Scape long panicled, Sepals and petals conform ovate acute spreading, Lip broadly cuneate 3-lobed, Crest elevated acutely 3-Iobed
20676 Pseudo-bulb elongated 2-leaved, Lvs oblong, Panicle racemose dense many-flowered, drooping, Lip obcuneate 2-lobed, Auricles ciliated, Crest of 4 tubercles, Wings of column oblong ciliated
20677 Pseudo-bulb narrow angular, Leaves lanceolate channeled, Scape panicled with many-flowered branches, Upper sepal unguiculate obovate, lateral ones longer spatulate-lanceolate, Petals broader obovate curled, Lip. deltoid with rounded angles, Crest tubercd at base bilamel. at top, Wings of col. scimitar-shaped toothed
20678 Leaves ensiform short equitant, Scape simple 1-flowered, Upper sepal obtuse, lateral ones acute collateral green, Petals obtuse undulated larger, Lat. Lobes of lip small roundish unguic., middle one much larger rndsh 2 -libd emarg. on both sides towrds marg., Crest depr. 5 lobed trunc. at top, Wings of col. crenulate
20679 L.vs obl.-ac. stiff fleshy, Scape flexuous panicled many-flwd, Seps nearly ent. upper rndsh., lat. ones spat., Pets rndsh crenately curled, Lat. lobes of lip short revol., mid. one renif., Crest of 2 lobes and 3 callosities
20680 Pseudo-bulb 1-1vd, Leaf curiaceous, Scape panicled elongated, Pedicels 1-2-flowered, Sepals and petals oblongovate curled, Lip 3-lobed 5-tubercled above the base, Middle lobe emarginate rather fan-shaped
20681 Bulbless, Leaves elliptic-oblong, Panicle ample, Sepals obovate-spatulate wavy, Petals conform but narrower, Lip tripartite with 5 tubercles middle, Wings of column deflexed oblong
20682 Pseudo-bulb ovate 2-leaved, Leaves ligulate-lanceolate, Scape racemose, Lateral sepals united almost to the middle, Lip 3-lobed bilamellate at base, Middle lobe bifid
20683 Bulbless, Leaves oblong acuminate flat spotted growing singly, Racemes compact stiff, Sepals and petals similar spatulate wavy, Lip roundish auricled at base with scarcely any crest wavy in front like the letter W elevated with a toothlet on each side, Wings of column rounded a little lobed [white tinged with green
20684 Column short obtuse protuberant at base forming an obtuse angle with the lip. Flowers large variegated, Lip [dulous connate at base, Petals oblong flat, Lateral lobes of lip small obtuse, midale one transverse 20685 Pseudo-bulb oval 2-leaved, Leaves narrow thin, Scape 2-fwd equal to leaves, Lateral sepals elongated penscape, Sepals and petals distinct oblong obtuse uniform all sessile, Lip cuneate dilated retuse at top somewhat lobed at sinus, Crest excavated smooth 3-lobed bilamellate in front, Wings of column short truncate

History, Use, Propıgatıon, Culture,
3238. Leochilus. Similar in habit to Oncidium, and they may be cultivated and treated in the same manner.
3239. Acianthèra punctata is a small plant with the habit of Pleurothális, with oval leaves and 5-6 greenish gres flowers.

20687 Lip fiddle-shaped 2-lobed much larger than sepals, Segments roundish flat with 3 tubercles above the base villous at base, Wings of column short
20688 Leaves fleshy acuminated serrulated, Flowers panicled, Upper sepals united into a spoon-shaped body, Petals obovate emarginate unguiculate cuspidate, Lip 3-lobed, Lateral lobes small, middle one broad 2-lubed with a toothed claw and doubie fleshy crest, Wings of column hatchet-shaped acuminated entire
20689 Pseudo-bulb ovate 2-edged 3-4-ribbed 2-3-leaved, Leaves ensiform acute, Scape long racemosely panicled, Sepals linear-lanceolate wavy free, Petals conform incurved, Lateral segments of lip short rounded, middle one roundish concave acute, Crest ovate depressed, lower halr lined, upper ribbed, Column neariy wingless
20690 Bulbless, Leaves thick ovate-lanceolate acute, Scape panicled, Sepals roundish wavy unguiculate concave free quite entire, Pets much larger oblong obtuse emarginate curled, Lateral lobes of lip oblong fleshy acute with revolute edges, widdle lobe reniform 2 -lobed with 4 twin tubercs in mid., Wings of column linear obtuse
20691 Pseudo-bulb ovate furrowed 1-leaved, Leaves narrow lanceolate acute, Racemes subcompound many-fowered, Sepals and petals linear-lanceolate wavy acute reflexed, Lip reniform emarginate, Lateral segments roundish erect glabrous 5 -toothed bidentate at apex, Wings of column large oblong toothleted
20692 Pseudo-bulb elongated ovate 2-edged, Leaves long ensiform recurved at top, Raceme compound many-fowered Seps and pets linear-lanc. wavy equal to lip, Lip constricted in middle cuneated at base dilated and rounded at top 2 -lobed, Crest depressed downy 3 -lobed at top, Wings of col, elong. truncate erose sphacelate
20693 Tufted, Pseudo.b. nar.-lin. scaly furrowed 1-lvd, Lvs lin.-lanc. obt. wavy apicu., Scape 1-flwd short, Lat. seps connate at base obov.obl. like pets, Lip fiddle-shaped, Mid. lobe large emarg., lat. ones short fringed in
\(\beta\) Mid. lobe of lip yel. with a brown border
[sinus, Crest downy fringed, Wings of col. trunc. erose
[short, mid. emar. obt., Disk pulv. with small tub. behind at base
20694 Leaves acuminate keeled, Corymb loose, Bracts obtuse membranous, Lip linear 3-lobed, Lateral lobes straight
20695 Racemes nutant sheathed at base, Lateral sepals connate, Lip oblong convex retuse with downy crest below the middle melliferous at base
20696 Pseudo-bulb ovate, Leaves lanceolate, Scape erect, Flowers secund racemose, Sepals and petals linear, Lip lin.-obl. emarginate with a melliferous crest at base, Lamellæ 2 short truncate furnished with 2 filif. glands

20697 Leaf solitary ovate obtuse glaucous dotted with purple, Sepals villous outside dotted with purple inside, Lip purple, Petals dotted, Racemes few-flowered drooping spath iceous at base
20698 Rachis flexuous winged, Bracts ovate acute falcate cucullate, Petals oblong acute, Lip large obovateroundish
20699 Leaves distich imbricate blue from bloom beneath, Flowers pure white except a spot of yellow at base of each division
20700 Pseudo-b. very narrow 2-edged smooth, Lvs linear ensif. twin, Scape compr. closely sheathed, Rac. many-flwd, Brcts ellowish keeled length of peduncs, Seps and pets lin. acum., Lip ov,-lanc. curled dwny at base inappen. 20701 Pseudo-bulb ov. 2-lvd, Lvs nar. shorter than racs, Bracts ov. scale-formed, Seps and pets obl. eq., Iip rotmd-
\(\beta\) Column and lip yellowish
[ish curled convol, about the col. with 5 lameilæ, Col. downy 2 -eared at base
20702 Pseudo-bulb oval 2-leaved, Leaves ensiform narrow erect longer than scape, Raceme few-flowered loose, Bracts small setac., Seps and pets lanc. equal, Lip cord. constricted in middle rounded at apex with 5 abrupt lamel.
20703 Scape panicled, Sepals and petals oblong-lanceolate apiculate, Lip obovate rigid crestless lamellate with central incurving veins, Margins of column simple, Flower 2 inches in diameter

20704 Pseudo-b. ov. ribbed 2-lvd, Lvs ligu.-lanc., Rac. few-flwd, Bracts acum., Seps and petals conform ovate-oblong wavy, Lip obl.-cun, retuse apicu, subsinuated with many trun. lamellæ in disk, Col. biden.with falcate wings
20705 Pseudo-bulb ovate-oblong, Leaves striated, Racemes many-flowered, Sepals and petals lanceolate wavy, Lip cuneate roundish bilamellate at base, Column bidentate in middle, Clinandrium entire
20706 Pseudo-bulb 2-leaved oval 2-edped, Leaves ligulate obtuse, Scape terete erect sheathed, Raceme distich manyfowered, Bracts keeled convolute acuminate, Sepals and petals linear-obovate acute stellate, Lip oblong wavy acute, Wiugs of column scimitar-shaped entire
20707 Pseudo-bulb ovate compressed subangular 2-leaved, Leaves broad-ligulate acuminate striated obliquely emarginate, Scape simple. Flowers racemose, Bracts short scale-formed, Sepals and petals fleshy obovate-lanceolate acute, Lip membranous oblong apiculate toothed on both sides bilamellate at base, Wings of column fal-
\(\beta\) Lip subhastate, Lateral segments larger
[cate entire
\(\gamma\) Leaves narrower, Lip with 4 lamellæ at base, Horns wanting
20708 Scape long filiform few. flowered, Sepals and petals lanceolate conform acute flat, Lip cuneate bifid furnished at base with subtuberculate teeth, Wings of column small cuneate truncate
20709 Pseudo-bulb short ovate furrowed 2-lvd, Lus lin.-obl., Scape longer than leaves, Rac. 8-10-flow, Bracts small, Seps ov.-lanc. acuminate, Pets ovate wavy, Lip large roundish fiddle-shaped bilamellate, Column bidentate
20710 Pseudo-b. oval compressed corrugated l-lvd many-ivd at base, Lvs ligulate acute flattish keeled much shorter than branches of scape, Bracts lanc. much shorter than peduncs, Seps and pets ov, acum., Lip unguic. cord. obov., Limb subrep. and flat reflexed at apex downy in mid. obsoly lamel. at base, Wings of col. multifid

3240. Telipògon. Curious little terrestrial plants. They will grow well in turfy peat. The plants require moisture, heat, and shade.

20711 Close to maculàtum in habit, but has a yellow wedge-shaped lip. It differs also from C.filipes in the shape of the lip

20712 Leaves shorter than slender scape, Lateral sepals acuminate, Lip unguiculate obovate apiculate warted shorter than sepals with villous recurved lamellæ
20713 Sepals ovate-lanceolate acuminate, Lip oblong acuminate wavy much shorter than Iateral sepals
\(\beta\) Flowers green, Sepals and petals longer and narrower
20714 Lateral sepals elongated double the length of the lip, Lip oblong lanceolate at top rather wavy
20715 Pseudo-bulb oblong 2-edged, Leaves twin oblong sessile wavy length of raceme, Sepals linear acuminate, lateral ones tailed, Petals linear acuminate, Lip linear-lanceolate acuminate with downy lamellæ
20716 Pseudo-b. obl. 2-edged 2-leaved, Lvs oblong obt. shorter than many-flwd raceme, Bracts spreading scale-formed, Sepals linear acuminate, Petals conform shorter, Lip cordate-ovate curled with connate downy lamellæ
20717 Pseudo-bulb oblong compressed 2-leaved, Leaves obtuse shorter than many-flowered raceme, Bracts spreading scale-formed, Seps and pets lin. acum. very long, Lip cord.-subrhomboid acum. curled with bidentate lamellæ
20718 Pseudo-bulb oval 2-leaved, Leaves narrower ensiform erect larger than scape, Raceme loose few-flwd, Bracts small setaceous, Sepals and petals lanceolate equal, Lip cordate constricted in middle with 5 unequal lameliæ
20719 Sepals and petals nearly equal linear acuminate, Lip elongated cochleate acuminate
20720 Pseudo-bulb compressed 2-3-leaved, Scape nutant many-flowered, Sepals linear acuminate, lateral ones very long, Lip oblong-lanceolate acuminate longer than petals with villous lanellæ
20721 Pseudo-bulb narrow 2-edged, Leaves oblong-lanceolate, Scape many-flowered equal to leaves, Sepals acuminate, tateral ones twice as long as lip, Lip rhomboid wavy shorter than petals with straight lamellæ
[Mule between \(P\). amábilis and \(P\). ròsea.
20722 Petals hroadly rhomboid acute, Lat. lobes of lip cuneate obtuse angled, middle one ovate bicirrhose at apex, 20723 Lvs obl. cori. ac, recurv. at top, Scpe nod. brnchd twisted clav., Flws fleshy, Seps ov., Pets oval a little broader, Lip ascend. tripar., Lat. segs lin.-spatu. lunate, mid. one ovate, Crest lunate roundish depressed emarginate
[deeply 3-lobed downy inside and with a conical spur at base, Lat. lbs incurv., mid. one dilated at apex 2-]bd
20724 Lvs terete obt., Racs 2 or many-flwd longer than Ivs, Seps and pets suborbicular rather wavy spreading, Lip 20725 Leaves distich channeled, Racemes many-flowered, Sepals coriaceous unguiculate obovate obtuse, Lip 3-lobed 3 lined with a short blunt spur, Lateral segments rounded, middle one broader cuneate emarginate
20726 Lis channeled recurved truncate obliquely tridentate, Raceme erect 3-flowered, Seps oblong obtuse arched, Pets narrower incurved, Lip 3-lobed, Lateral lobes short incurved, middle one vittate oblong saccate at apex unequal 3-horned, Horns short conical
20727 Leaves coriaceous, Spike loose many-flowered
20728 Lvs distich coriaceous truncate, Spike dense erect many-flowered, Bracts oblong concave obtuse, Lip leathery linear-obl, with 2 diverging lobes having 3 lamellæ along the middle and 2 trian. acum. lobes, Spur short obt. 20729 Leaves channeled obliquely 2 -lobed, Raceme many-flowered dense pedunculate pendulous, Sepals obovate obl. obtuse fat incurved, Petals narrower, Lip obl. apiculated flat with 5 thick elevated veins, Sac downy inside 20730 Roots thick, Leaves distich coriaceous obliquely emarginate obtuse shorter than many-fowered lateral raceme, Bracts coriaceous cucullate scale-formed, Flowers large flat coriaceous but the flower buds are globose, Sepals obovate-cuneate obtuse, Lip triangular saccate at base with a transverse line in the middle
20731 Stem tall, Leaves loose membranous obliquely tridentate, Racemes lateral many- fwd, Flowers distant, Sepals and petals obl. obovate wavy of one colour obt., Lip 3-lobed, Lat. libes obt., middle one cuneate 2-1bd
[oblong channeled spongy bilamellate denticulate, Spur narrow obtuse
20732 Raceme simple, Sepals oblong, Petals linear-spatulate, Lip 3-lobed, Lateral lobes ascending acute, middle one 20733 Lvs distich coriaceous obliquely and acutely bidentate, Spike many-flwd, Seps and pets obov. undulated, Jower ones incurved and larger, Lip teated at base obcuneate ret. auricled bilamel. bitubercu. behind ben. the apex 20734 Lip fleshy sessile with a small bearded tubercle, Column short tomentose unidentate on both sides, Lvs distich, Peduncles long racemose at top
20735 Lip slipper-shaped, Terminal Iobule truncate obsoletely tridentate inflexed furnished with a 2-lobed channeled appendage inside, Column twisted
20736 Raceme dense cylindrical on long peduncles panicled and simple, Sepals and petals obovate-linear obtuse, Lip ovate acute, Spur obtuse

20737 Lvs long channeled truncate, Racemes cylindrical dense-flowered arched equal, Sepals ovate, Spur compressed downy inside
20738 Stem short, Leaves thick distich ligulate truncate or toothed at top, Racemes oblong erect shorter than leaves, Sepals and petals ovate spreading nearly equal, Lip acuminate concave, Spur short compressed drooping
20739 Stem strong erect, Lvs large oblong acute, Racemes lateral many-flwd, Sepals and petals oblong bluntish 20740 Leaves distich imbricate lorate channeled obliquely truncate at apex, Racemes short spreading, Bracts small, Sepals and petals ovate acute spreading, Lip linear obtuse recurved, Spur straight pendulous
20741 Leaves ling channeled arched acute mucronate equal to pendulous racemes, Seps ovate, Pets oblong narrower, Lip oblong emarginate ribbed on both sides, Spur compressed very blunt downy inside
20742 Leaves distich coriaceous obliquely 2-lobed at apex, Racemes a little branched, Sepals and petals linear obtuse fleshy, Lip subsagittate recurved papillose with erose edges, Spur obtuse [formed, Spur obtnse falcate
20743 Young stem 2-edged, Lvs distich stem-clasp.wavy obt. obliq. triden., Rac. cylind. pend. Lip fleshy small tooth20744 Stemless, Leaves lorate acuminate obliquely bidentate at apex, Corymbs many-flowered on short peduncles, Sepals and petals obovate-oblong obtuse, Spur of lip inflated orbicular, Lamina lunate roundish ciliated

History, Use, Propagation, Culturc,
3241. Arrhýnchum. A pretty little epiphyte.
3242. Malachadenia. A singular plant requiring the culture of the hothouse epiphytes.

20745 Leaves distich coriaceous, Lip feshy concave at base biauriculate oval cleft horizontally wrinkled adnate to spur, Spur ascending obtuse recurved thickened at the mouth and nearly closed
20746 Plant with creeping 1-leaved pseudo-bulbs, Scapes radical, Flowers fleshy galeate
20747 This plant has flowered in several hot-houses, but appears to be nothing but a narrow-leaved variety of \(S\). ros20748 Leaves terete fliform, Racemes many-flowered drooping, Sepals and petals reflexed, Lip ovate at top, Throat bidentate on both sides didymous at top of spur, Column glabrous
20749 Lvs lorate keeled truncate at top nearly equal, Spikes cylind. drooping dense-fiwd equal to lvs, Lat. seps ov. obt., Petals and upper sepal twice the size, Lip ovate-oblong obtuse, Spur blunt shorter than ovarjum
[one and pets lin. blunt, Lip fleshy 3-lobed, Mid. lobe roundish, lat. ones very thick transversely truncate 20750 Stem leafy, Lvs narrow-lanc. coriac. acute, Corymbs few-fwd nearly sessile, Lat. seps obliquely ov. acute, upper 20751 Lvs distich coriaceous ensiform obliquely retuse, Panicle spreading, Seps and pets obov. obt. nearly equal, Lip hastate fleshy downy, Middle segment cordate triangular, Spur conical, Column downy bidentate in front
20752 Leaves distich lorate obliquely emarginate wavy, Spike recurved compound, Sepals and petals oblong rounded, Lip roundish transverse with a subventricose downy sac
20753 Spikes dense short many-flowered, Flowers pilose, Lip ovate acute crested in middle with a 2 -lobed dorsal tooth, Lobes acuminate denticulated, Spur blunt longer than lip
20754 Lvs oblong distich rounded emarg. at top much shorter than elong. peduncle, Panicle small contracted, Flws crowded corymb., Seps and pets obl.obt., Lip 3-lbd, Lat. lbs erect rndsh, mid. ov. acute smooth, Spur fleshy
20755 This species has the habit of Vánda, with long stalked spikes of small ysh brown and pink rndsh fleshy blossoms. 20756 Jeaves oblong obtuse almost equally 2-lobed at top, Flowers panicled, Branches simple rigid, Petals and sepals linear obtuse, Lip reniform with membranous 2 -lobed tooth, Spur ventricose
20757 Leaves fleshy channeled arched stiff, Branches of simple panicle densely spicate nutant, Lateral lobes of lip minute erect, middle one roundish, Spur small obtuse fieshy
20758 Flowers small pink stained at base with dingy purple
[ment roundish emarg., lat. ones acute, with an elevated tooth in middle, Cup of clinandrium entire rounded 20759 Pseudo-b. oval, Racs many-flwd cylind., Pedicels longer than internodes, Lip downy fiddle-shaped, Middle seg20760 Pseudo-bulb ovate, Lvs solitary linear channeled spreading emarginate, Scape panicled, Lip 3-lobed, Lateral segments triangular, middle one elongated linear with a bilamellate disk, Arms of column biglandular
20761 Leaves linear-lanceolate seated on the pseudo-bulbs, Peduncles radical panicled, Flowers pedicellate

\section*{20762 Leaves distich channeled obliquely tridentate at apex, Ovarium twisted, Petals oblong-ovate wavy}
[obtuse, Petals conform larger, Lip larger ovate obsoletely 3-lobed, Claw saccate jointed, Spur small 20763 Leaves channeled retuse mucronate, Kacemes cylindrical many-flowered erect equal to leaves, Sepals oblong [rulate somewhat bidentate, lateral ones erect ovate, Spur horned incurved 20764 Lvs flat obtuse oblique, Racs many-fwd nutant, Seps and pets nearly equal obtuse, Lip large ovate retuse ser[shaped, Lateral lobes erect, middle oblong inffexed toothed, Spur conical secund green 20765 Lvs obliquely emarg. mucronate, Racs pendulous many-flwd longer than lvs, Seps and pets fleshy, Lip funnel20766 Leaves coriaceous oblique and obtuse at apex, Raceme dense nutant rather panicled, Sepals roundish-oblong, Petals conform but twice the size, Lip ovate wavy entire with one tooth at base on each side, Column short
20767 Leaves distich channeled broad thick obtuse oblique at top, Raceme pendulous many-fowered, Sepals obovate obtuse, Petals conform, Lip large 3-lobed denticulate at top, Middle iobe large
20768 Lip horned, Lat. segs roundish quite entire, middle one short rifid glabrous. Near quinquevúlnerzm.
20769 Racemes oblong horizontal 12 -flwd, Bracts ovate small scabrous, Sepals and petals oval obtuse, Lip horned ascending 3-lobed pressed to column, Lateral lobes oblong denticulate, middle one linear bifid
20770 Leaves rounded at end 2-lobed sometimes toothed, Spikes strict, Sepals and petals acute, Lip rhomboid quite entire acuminate, Ovarium 3-winged equal
[pets lanceolate spreading, Lip conform a little larger shorter than filiform emarginate spur 20771 Stem short, Leaves cuneate-obovate obliquely 2-lobed reticulated, Racemes long pendulous many-fivd, Seps and 20772 Stem imbricate, Lvs distich compressed recurved imbricate obtuse channeled, Flws axil. solitary, Seps ovate, Pets narrower secund obtuse, Lip behind obl. concave triden., Spur terete horizontal shorter than pedumcle 20773 Stem short, Los obl. 3-nrvd oblique at apex, Spikes secund many-ftwd horizon. crowded shorter than Ivs, Seps 20774 and pets nrly eq. nar. ov. spread. at top, Lip similar 2 -lbd at base biden. downy in mid., Spur obt. inc. behind temless, leafless, Roots copious elongated articulated, Peduncles generally 2 -flowered, Petals and sepals obl.lanceolate reflexed, Lip 3-lobed, Lateral lobes small erect, middle lobe broad obcordate, Spur filiform 20775 Stem short radicant, Lvs distich obov.-lanc. obliquely acum. opaque striated, Racs long pend. many-fowered, Seps and pets lanc. spreading, Lip conform a little broader shorter than filif. spur, Crest of anther glandless 20776 Stems creeping, Lvs distich coria. ovate obliquely erose at top, Spikes equal in length to the Ivs, Flws resupin., Seps and pets galeate. dentic. ov.-lanc., Lip fid.-shpd obtuse dentic. 1.thd at base, Spur arched length of lip, 20777 Stemless, Leaves distich oblong rather wavy recurved oblique at top, Racemes dense nutant axillary shorter than leaves, Sepals and petals linear-lanceolate, Lip finged cordate-ovate truncate, Spur short lanceolate

\section*{and Miscellaneous Particulars.}
3243. Acriópsis. Curious little epiphytes, with compactly arranged flowers in racemes about 2 inches long. Their culture is the same as for other orchideous epiphytes.

History, Use, Propagation, Cuiture,
3244. Limatodes rosea is a terrestrial plant, has much the habit of a species of Cationthe, and may be cultivated and treated like the species of that gemus. It is a splendid plant when in blossom, and fluwers most abundanily. The

20778 Caulescent, Leaves distant lanceolate acute, Peduncles axillary l-flowered, Sepals and petals ovate-lanceolate acute, Spur slender pendulous equal to peduncle
20779 Caules., Lvs distich channeled acutely and obliq. biden. at apex, Spikes lat. horizontal secund, Seps ov., Pets inear, Lip 3-lbd, Lat. lbs acuminate longer than triang. middle one, Spur pendulous clavate compr. at base
20780 Leaves broad distich, Lip roundish convolute at top cuspidate with an elevated acuminate broad flat line in middle, Spur horizontal acuminate straight twice as long as lip
20781 Stemless, Leaves channeled recurved equal to pendulous recurved raceme. Flowers distant divaricate, Sepals ovate, Petals linear acute, Spur arched inflated at top diaphanous
20782 Leaves coriaceous distich unequally 2-lobed at apex, Flowers in lateral horizontal racemes, Bracts membranous, Sepals and petals almost uniform linear taper-pointed, Spur long blunt
20783 Leaves narrow channeled obliquely obtuse, Spikes short dense cylindrical, Flowers beset with black hairs outside, Lip cuneate truncate 3 -lobed, Spur curved clavate obtuse length of lip
[short, middle roundish crested undivided
20784 Scapes slender many-flowered sheathed at base, Lip saccate at base 3 -lobed bilamellate, Lateral lobes acute
20785 Scape erect, Lus broad obl. petiolate acum., Racs many-fwd, Lip 3-parted crested by 5 series of tubercles, Lat. segs lin. subfal., mid. one cun. emarg., Spur long falc. clav., Col. oblique bifoveate in front, Ovary downy
20786 Pseudo-b. ovate or roundish striated reticulated, Lvs plicate broad-lanc. acum. channeled glabrous, Scape 3 feet radical hairy with small lanc. adpressed sheaths, Spike 2 feet, Flws villous white stained with crimson in mid., Seps refxd, Lip longer than seps 3-parted, Segs rnded, mid. one bifid, Col. short thick, Spur filif. inflxd
20787 Like C. veratrifolia in foliage and general habit, but with far finer flws, at first white, then changing to yellow, so that the upper part of the raceme is pure white and the lower bright yellow
[dwny acute
20788 Racs loose dwny, Seps and pets ac., Lip 3-1bd joined with col. dwny at base bilam., Mid. lb. 2-lbd 3-kceled, Spur
20789 Scape shorter than leaves, Scales loose ventricose, Racemes many-flowered corymbose, Lip rather connate with column, Middle lobe cuneate 2-lobed, Disk bilamellate, Spur long straight pendulous clavate
20790 Leaves oblong glabrous twice as long as thick scape, Raceme dense cylindrical glabrous, Bracts membranous deflexed deciduous, Lip hastate, Lateral lobes short obtuse, middle one lanceolate, Spur hooked
20791 Leaves oblong-lanceolate concave 7-9-nerved glabrous, Scape downy at top, Raceme dense pyramidal, Lip joined to column 2 -lobed, Lateral lobes ovate short, middle one cuneate 2-lobed longer with 3 tubercles at base and warts along the middle, Spur glabrous, Ovary downy
20792 Pseudo-bulb ovate sulcate 1-leaved, Leaf lanceolate acuminate striated sheathed at base, Scape radical glabr., Spike elong. loose many-flwd, Sepals and petals lanceolate, Lip erect oblong-spatulate clasping the col. 3-lbd, Lat. lbs short obt., mid. one broad semi-orbic. mucr., Disk lamel. spotted, Spur short obt. incrvd
20793 Pseudo-bulb fusiform, Leaves oblong-lanceolate plicate smooth, Scape loosely many-flowered shaggy, Bracts curved backwards, Lip oblong flat retuse, Spur straight blunt horizontal, Columu dwarf downy
20794 Sepals linear acute, Petals conform obtuse, Lip obovate emarginate rather wavy narrowed at base and lamellate, Wings of column semicord. acute
[curved length of ovy, Wings of col. cun. dentic., Anthr dwny 20795 Bracts distich cucullate ovate acute, Seps and petals ovate acute, Lip oblong purple at base bident., Spur re20796 Bracts ovate acute, Sepals and petals ovate acute, Lip oblong emarginate obsoletely bidentate at base spurless gibbous, Wings of column ovate acute, Anther villous
20797 Lip'serrul. roundish slightly 3 -lobed, Mid. lobe emarg., Spur conic., Lat. sepals reflexed, Bracts length of fiws 20798 Leaves oblong-lanceolate acuminate loosely sheathed, Spike oblong many-Howered, Sepals ovato acute, Lip broader than long obsoletely 3-lobed flat, Lateral lobes emarginate much larger than middle one which is acute, Spur pendulous horned shorter than lip, Bracts green acuminate sometimes longer than flower
20799 Lip 3-lobed, Lobes ovate, mid. one smaller emarginate all crenately cut, Pets obt., outer ones refixd, Spur cylindrical ascend, longer than ovary, Bracts foliac, twice as long as flws. There is a variety with purple fiws
20800 Leaves spotted, Spike dense secund, Flowers small, Petals subulate, Lip spreading oblong equal to the sepals gibbous at base 3-lobed, Middle lobe obovate mucronate

20801 Lip 3-parted, Segments wedge-shaped deeply-toothed, middle one emarginate, Lateral sepals obtuse a little toothed, Horn subulate ascending length of ovarium
[obl. obt. moy-flwd, Seps lin.-conv. recurved, Petals conform smaller, Lip obl.-ac., Spur shrtr than ovy 20802 Leaves twin radical cordate orbic. flat papillose, Sheaths adpressed to stem acute foliac. complicate, Spike 20803 Lower Leaves broad-ovate obtuse many-nerved becoming smaller and oblong as they ascend the stem, Upper ones near the bracts tinged with red, Bracts foliaceous coloured, Sepals and petals linear-lanceolate acute, Lip large with a projecting point and curved denticulated border
20804 Lip wedge-shaped dilated, Lateral segments broad, middle one oblong scarcely emarginate
20805 Bulb roundish, Racemes loose longer than ovaria, Lip with 2 teats crenate
20806 Lip obovate-triangular velvety undivided bigibbous at base and with an inflexed rhomboid appendage at top, Petals convolute velvety about equal to the short beaked column
20807 Inner segments of perianth convolute villous shorter than rostrate column, Middle seg. of lip obovate retuse shortly apperidiculate velvety, Lat. segments drawn out into a subulate elongated hooked appendage each

\section*{and Misccllaneous Particulars}
pseudo-bulbs have the peculiarity of producing a kind of neck about their middle.
The genus was first made known by Blume, and the species mentioned by him are said to be fibrous-rooted plants.

History, Use, Propagation, Culture,
3245. Sajcoglóttis is a genus scparated from Spiránthes by Presl. The species require the constant heat of a stove, and thrive in a rich loamy soil, kept moist when in a growing state, but dry after the leaves have decayed.
3246. Peristylis. A genus separated from Habenària, and may be cultivated in the way recommended for Savcoglóttis.

20808 Lip bigibbous ovate acute 3 -parted villous, Lateral lobes deflexed acute, middle one ovate, Petals ciliated acute 20809 Lip oblong nearly square violet with a white horseshoe-shaped spot in middle, Sepals rose-coloured

20810 Stem 2-leaved, Leaves wavy acuminate, Spike few-flowered, Bracts acuminate green shorter than ovary, Sppals ovate acute nearly equal, dorsal one horizontal, Petals undivided galeate obtuse, Lip entire ensiform, Spur pendulous twice as long as ovary 2 -lobed at apex
20811 Stem leafy, Leaves oblong cucullate at base spreading gradually decreasing into bracts, Racemes many-fiowered, Bracts green, lower ones foliaceous, upper ones small ovate, Lip 3-parted, Lateral segments linear a littie shorter than the broader middle one, Spur pendulous clavate twice the length of ovarium
20812 Tubers undivided, Lip tripartite, Lateral lobes curled upwards pectinate, middle one stretched out linear-spatulate, Horns veiny, Two inner petals linear-falcate, Flowers large

20813 Leaves radical stellate, Flower nutant, Lips about equal in length, Galea acum., Lip tapering to apex truncate 20814 Lvs radic. stell., Bracts on scape 2-3, Flower erectish, Lower lip shortest, Gal. acutish, Lamina of lip ent.
20815 Leaves radical stellate, Bracts of scape near the flower, Flower erect, Lower lip rather the longest, Galea acuminate, Lamina of lip entire tapering to apex and exceeding the column
20816 Leaves radical stellate, Scape furnished with one bract in the middle, Lamina of lip emarginate equal to column

20817 Lip 3-lobed, Lobes ovate obtuse, middle one larger having 9 veins with as many parallel equal lamellæ at base, Sepals obtuse concave warted outside, Veins of petals warted

20818 Plant olive-brown hairy, Scales distant lanceolate disposed generally about the stem, Spike 7-8-flowered, Bracts lanceolate acuminato incurved longer, Ovary hairy, Sepals glabrous, upper one retuse, lateral ones obtuse concave at top, Lip glabrous at base sagittate villous above base obov, obtuse conc. shining a little crerated
20819 Leaves oblong coriaceous rosulate glabrous, Scape leafless hairy with 2 - 3 sheaths, Spikes ovate hairy, Bracts linear-lanceolate glabrous on back, Lip oblong rounded veiny, Claw excavated at apex 2 -legged at base
20820 Leaves oblong acute spotless, Scape rufescent downy as is the ovarium, Lateral sepals deflexed, Lip 3-lobed cucul., Mid. lobe renif., lat. ones ascending roundish, Claw vill. on both sides, Callosities elong, free twisted
20821 Leaves before flowers, Sheaths of stem inflated glabrous diaphanous, Flowers capitate tomentose outside, Lip flat at top oblong quite entire
20822 Leaves radical spatulate acute, Scape glabrous, Flowers villous, Leaflets of perianth narrow dirty white at length rufescent glabrous towards apex, Lip spreading acuminate
20823 Leaves radical spatulate acute pale grien, Scape downy towards apex, as are the flowers, Leaflets of perianth yellowish green, outer and lower ones falcate obtuse, Lip deflexed tridentate

20824 Leaves oblong-lanceolate acute, Scape pilose, Spike conical thyrsoid compact, Bracts lanceolate green shorter than pilose fiowers, Sepals and petals linear-lanceolate acuminate, Lip conform glab. nar. at base channeled
[spike approximate 20825 Lower leaflets of perianth revolute, inner one linear, Lip linear-oblong with naked margins, Flowers of 20826 Lower leafets of perianth revolute oblong acute, inner ones linear obtuse, Lip oblong cuneate retuse at apex warted with callous tubercled margins
20897 Stem 2-leaved, Lvs cordate acute, Spike secund, Seps and pets ovate-lanceolate acute nearly equal, Lip 3-lobed saccate at base, Lateral scales of anther elongated clavate
20828 Stem elongated, Leaves elliptic-lanceolate, Spike many-flowered, Lip nearly entire obtuse as are the pets, Spur globose saccate, Seps ovate acuminate green

20829 Leaves rich green the midrib silvery white and the rest of the surface marked with fine transverse silvery lines
20830 Leaves narrow-lanceolate marked with a bar of gold colour through the centre upon a dark green ground
20831 Leaves having a narrow bar of gold colour down the centre, otherwise marked with golden meshes on a dark velvety green ground
20832 Leaves green thickly netted with silvery lines
20833 Leaves curiously veined and appearing as if covered with a film of silver, Flowers small white in short spikes

20834 Leaves of a deep reddish olive green with a velvety surface traversed by fine golden yellow veins, and a bar of gold colour down the centre

3247. Physurrus. This genus rivals the Ancectochilus in the beauty of the leaves. It requires the same kind of treatment as that plant. It is found on the hills of Botofogo near Rio Janeiro among decayed leaves,
3248. Cheiróstylis marmorata is less beautiful than the Anocctochìlus setaceus, a plant of similar habit. A damp heat is required. Three parts of chopped Sphagnum and one third of decayed leaf-mould make the best compost tor it.

Hislory, Use, Propagation, Culture,
20863. Aristolochia grandiflòra. The flowers of this species are very large. On the banks of the river Magdalena children adorn their heads with them in place of hat or bonnet. A. macradenia does very well cultivated in a pot and trained to a balloon trellis. A piece of the root of A. anguicida, according to Jacquin, mixed with the saliva by mas-

20835 Lip bicarinate at base inside, Lateral segments about equal to middle one, Petals obovate
20836 Leaves ovate-subcordate succulent on short petioles, Flwrs twin, Seps and pets narrow-oblong erect channeled Lip membranous obovate emarginate with 3 downy elevations at base, Column clavate bearded on the face, Ovary caliculate

\section*{DIANDRIA.}

20837 Stemless, Lvs coriaceous acute channeled spotted, Scape downy, Dorsal sepal cuspidate ciliated with revolute edges, Pets linear-oblong rather wavy fringed, Upper margin warted, Sterile stamen lunate downy
20838 Leaves 2 broad plicate, Flowers solitary
20839 Lvs distich long obt. slightly ntchd at apex sheathing at base, Scape gland. few-fixd, Lip with a notch in front of pouch and a large triang. tooth on each side, Lat. segs narrow lanc.-spat. acum. much longer thall outer
20840 Stemless, Lvs distich uniform leathery smooth, Scape bearing several flowers longer than leaves, Bracts as long as ovary, Seps ovate-lanceolate gracefully curved, Pets extended into very long pendent wavy linear tails, Lip oblong glandular on edge at base, Sterile stamens broader than long 2-lobed bristly
20841 Stem leafy plose many-flowered, Lvs ovate acuminate stem.clasping, Sterile stamen ovate acum. rather 3-lobed, Seps and pets oblong equal bearded at base bipartite in front at apex, Lip obovate constricted at mouth
20842 Lvs oblong ac. striated spotted equitant at base, Scape downy leafless, Dorsal sepal acum. ciliated with revolute edges, Petals oblong wavy downy, Sterile stamen lunate
[leafy, Lvs nearly glabrous
20843 Lobe of col. elongated cord., Mouth of lip shorter than peri, contracted crenul., Anthers awned on back, Stem
20844 Nearly allied to C. macránthum, but the 2 lateral innermost segms of perianth are much narrower and longer than the lip, the mouth of the lip is also larger and with a small cleft at the lower extremity, and is not so regularly notched and is deeper purple
20845 Lvs linear ciliated piliferous at top, Scapes and flwrs covered with glandular hairs, Rachis very villous, Panicle pyramidal [duncles crowded subcorymbose terminal, Ovarium linear 20846 Stem branched, Lvs crowded at top of branches subulate recurved membranous towards margins at base, Pe20847 Stems tufted, Lvs linear-subulate glabrous ending in a bristle-like mucrone, Scape panicled at top, Segments marked with a zigzag line around the mouth ovate nearly equal
20848 Lvs linear ensiform grassy with entire edges, Scape glabrous, Raceme simple downy, Lip appendiculate
20849 Tufted, Lvs radical rosulate copious linear acuteciliately scabrous on margins piliferous at apex, Scape glabrous hardly bracteate, Racemes and flowers covered with glandular hairs, Lip tuberculate
20850 Scape inarticulate glabrous furnished with one whorl of leaves beyond the middle, Radical leaves rosulate spatulate mucronate, Throat of corolla crowned, Lip appendiculate
20851 Stems short branched at base, Lvs glabrous lin.-subulate setaceously mucronate, Scapes and peduncs terminal naked panicled at top and beset with glandular hairs, Lip appendiculate on both sides, Ovarium cylind. elong.
20852 Scape covered with gland. down branched a little, Lvs flat elong. lanc. ensiform, Pets 4 wavy repand denticu. the 5 th obl. deflexed callous in mid. with 2 appends at base, Scales in throat 2 semilanc. ciliated denticulate
20853 Glabrous, Stems numerous leafy, Lvs linear acute, Upper ones fasciculately subverticillate, Flowers in terminal racemose spikes, Capsule compressed lanceolate
20854 Glaucous, Radical lvs rosulate lin,-spat., Caul. Ivs verticil., Racemes loose verticil., Calyx eq. 5 parted, Segments of corolla obov. 2 smaller, Throat crowned with capitate glands, Lip linear acum. tuberculate at base
20855 Scape beset with acute hairs, Raceme nearly simple, Capsule ventricose ovate, Leaves linear attenuate at base with the margins a Jittle recurved, Scales scarious
20856 Lvs rad. tftd lanc.-lin. acum. reflexed on the marg. naked and shining with elong. sheathg scales at base, Scpe twice as long as Ivs gland.-dwny panicled, Calyx bilab., Up. lip trifid, lower 2 -parted, Throat of cor. crowned
20857 Lvs radical linear glabrous piliferous with entire edges, Raceme simple, Rachis downy, Scape glabrous, Throat of corolla naked, Lip appendiculate
[ple beset with black glands 20858 Stem elongate innbricate, Lvs spatulate acute with denticulated edges, Scape leafless, Raceme cylindrical sim20859 Scape beset with acute hairs, Lvs radical spatulate apiculate ciliated, Panicle dense cylindrical glandularly tomentose, Rachis villous, Calyxes obtuse
20860 Scape glandularly pilose decumbent, Lvs linear reduplicate scariously pubescent, Raceme loose subcorymbose glandularly hairy

\section*{HEXANDRIA.}
[in a very long tail, Tube glabrous outside 20861 Lvs broad-cordate acute Peduncles solitary 1-flowered furnished with a perfoliate bract, Lip large entire ending 20862 Leaves large petiolate, Stipules stem-clasping oblong acute, Peduncles solitary axillary, Periantt, tubular bilabiate, Lower lip short, upper spatulate emarginate 6 inches long
20863 Lvs downy cordate acum., Peduncle solitary bracteate, Perianth large cordate ribbed outside reticulated downy, Tube inflated contracted in middle, Limb large cordate-ovate with a long tail
20864 Lvs cordate acute, Peduncles 1-flowered, Perianth large unilabiate obliquely pendent, Tube curved upwards, the lower part oblong furrowed and contracted, the upper part assurgent and inflated ending in a large shell-formed concave veiny white purple-spotted lip tailed at top

\section*{Order 2. DIANDRIA. Stamens 2.}
3249. 1939a. Pistic. Spathe tubular at base, and connate with the spadix. Limb spreading. Spadix female at base and male at apex. Anthers 3-8, or diandrous. Ovarium one, adnate to spadix, seated obliquely. Style thick, terminal. Stigma cup-shaped. Berry l-celled, few-or many-ovulate. Seeds cylindrical.

Order 4. TETRANDRIA. Stameas 4.
3250. 1971a. Fortunco \(a\) Lindl. Male aments lateral, heart-shaped, erect. Scales foliaceous, hairy inside, white, tetrandrous at base.-Female aments terminal, composed of dense, 1-flowered, erect, imbricate, mucronate, glabrous scales. Calyx 4-toothed, superior. Corolla none. Ovarium 1-cetled, compressed, 2 -winged. Ovulum solitary, erect. Style short. Stigmas 2, linear, spreading. Strobile oblong, composed of hard, mucronate, downy scales. Nut small, compressed.

Order 6. HEXANDRIA. Stamens 6.
3251. 1972a. Holbölla. Perianth 6-leaved, disposed in two series. Stamens distinct. Glands 6, opposite the base of the stamens. - Female flowers with 6 sterile stamens. Stigma simple. Berries 3, distinct, oblong, follicular, 1-celled many-seeded.
3252. 1972b. Akèbia. Perianth 3-leaved. Stamens free, Glands 6.-Female flowers with 6 sterile short stamens. Ovaria 3-9 distinct oblong-cylindrical, terminated by a peltate stigma.
3253. 1985a. Leopoldina. Spadix paniculately branched without a spathe. Lower flowers female, at base of branch; upper ones, male. Sepals 3. Stamens 6, flattened, connate at base--Female flowers. Ovarium turbinately trigonal, 3 -celled, 2 of the cel's small. Stigmas 3 , sessile, short, spreading. Berry drupe-formed, orbicular, compressed, 1-seeded.
3254. 1985b. Astrocáryon. Spathe fusiform. Flowers dense. - Male flower. Calyx trifid. Petals 3. Stamens filiform. Rudiment of ovary with 3 subulate styles.-Female flowers below the male ones, bracteate. Calyx urceolate 3-toothed. Corolla urceolate, tridentate. Style 1. Stigmas 3, confluent, conical or lobed. Drupe ovate, 1 -seeded, fibry. Nut with 3 pores at top.
3255. 1985c. Acrocomia. Spathe simple, lanceolate. - Male flowers dense on the upper parts of the branch, sessile. Calyx small, of 3 sepals. Petals 3, lanceolate-oblong. - Female flowers on the lower part, remotish, sessile. Calyx of 3 sepals. Petals 3. Cupula annular, 6 -toothed, girding the ovary. Ovarium ovate, 3 -celled, hairy. Style short. Stigmas 3, lanceolate. Drupe globose, l-seeded. Nuts lenticular, with 3 pores at the side.
3256. 198jd. GEnocárpus. Flowers bractless. Spadix double, inner one complete.-Male flower. Calyx tripartite, with keeled segments. Petals 3. Stamens 6, in bottom of corolla,-Female flowers. Sepals 3. Petals 3. Ovarium 3 -celled, 2 of the cells very small. Stigmas 3, sessile, conniveut. Berry l-seeded, fibry, crowned by the stigmas.
3257. 1985e. Wallíchia. Flowers sessile, bracteate. Spathes many incomplete-male flowers. Calyx tridentate. Petals 3. Stamens 6.-Female flower, Calyx urceolate trifid. Petals 3. Ovarium 2- rarely 3-celled. Stigmas 2-3, connate. Berry 2-3-seeded.
3258. 1985f. Martinèsia. Upper flowers male, lower female. Spathe 1-leaved.-Male flower. Calyx small, triquetrous, 3-lobed. Petals 3, acuminate. Stamens 6, adnate to petals.-Female flower. Sepals 3. Petals 3, with 6 barren filaments. Stigmas 3, sessile, ob:use, connivent. Ovarium 3-celled. Drupe globose, l-seeded.
3259. 1985g. Oncospérma. Spathe triple, inner one incomplete. Male flowers twin, female single. - Male calyx 3-parted, with keeled imbricate segments. Petals 3, valvate. Stamens 6 . Anthers sagitate, fixed by the base. -Fe male with 3 sepals and 3 petals, convolute. Ovarium 3 -celled, only 1 of which is fertile. Stigmas 3 , sessile, conniving. Berry 1-seeded.
3260. 1985h. Syagyus. Flowers sessile, bracteolate; male in the upper part, lower female. Spathe double: outer short, open at top; inner one fusiform, rather woody, open in frontits whole length.-Male. Sepals 3, triangular, membranous. Petals 3, rather fleshy, lanceolate, carinately crested, connivent. Stamens 6-16, inclosed.-Female flower with erect sepals and petals, the former keeled, the latter oblong and exceeding the sepals, imbricate. Ovarium 3 celled, 2 of which are abortive, therefore l-celled. Style none. Stigmas 3, sessile, pyramidately trigonal. Drupe oblong, 1 -seeded, fibry. Nut bony, with 3 pores at base.
3261. 1985i. Éutérpe. Flowers monœecious in the same spadix: lower ones male, sessile, bracteate. Spathe double, outer one short.-Male. Sepals 3, ovate, concave, keeled, imbricate. Petals 3, coriaceous, ovate or lanceolate, erect, valvate. Stamens 6, inclosed. Anther linear, subsagittate, fixed by the base, erect. Rudiment of pistil trifid. -Female. Sepals 3, ovate, obtuse, concave, imbricate. Petals 3, similar but thinner. Ovarium 3-celled, 2 of the cells small. Stigmas 3, sessile, acute, connivent. Berry l-seeded, globose, crowned by the stigmas, fibry. Nut smooth.
3262. 1985k. Maximiliana. Flowers sessile, bracteate. Spadix girded by a thick, woody, oblong, long-beaked, furrowed, simple spathe.-Male. Sepals 3, membranous, ovate-triangular. Petals 3, lauceolate, subcoriaceous, Stamens 6. Anthers linear, fixed by the back.-Female bracteate, situated at base of spadix. Sepals 3, imbricate. Petals 3, large. Cup membranous girding the ovarium. Uvarium ovate-conical, S-celled, 2 of the cells abortive, therefore only 1-celled. Stigmas 3, revolute. Drupe ovate, l-seeded, fibry. Nut bony, acuminate at top, with 3 pores at base.
3263. 1985i. Geónoma. Flowers monœecious in the same or in distinct spadixes, rarely diœecious, immersed in pits on the rachis; female ones single, male ones in twos or threes. Spathe double, rarely triple; outer one truncate, incomplete, concave; inner one compressed or fusiform.-Male. Sepals 3, concave and keeled. Petals 3, flat. Stamen 6. Filaments connate into a cylinder, free at top. Cells of anthers divaricate.-Female. Sepals 3. Corolla trifid. Stamineous urceolus 6 -toothed, covering the ovarium. Ovarium 3-celled. Style basilar. Stigmas 3, subulate, revolute. Berry 1-seeded.
3264. 1985m. Diplothèmium. Flowers, lower male, upper female. Spathe double: outer one shorter, open at top; inner one clavate or cylindrical, at length cleft in front.-Male flowers coriaceous, with 3 sepals and 3 petals: the former narrow-lanceolate and keeled, and connate at the very base; the latter ovate and a little keeled, erect or connivent. Stamens 6-12, or indefinite. Anthers sagittate, erect.-Female flowers coriaceous, ovate-globose. Sepals 3 , ovate, keeled, imbricate. Petals 3, entire or repandly toothed. Ovarium globose, trigonal, 3-celled, 2 of the cells abortive, therefore only i-celled. Stigmas 3, sessile, triquetrous, pyramidally conniving, at length spreading. Drupe ovate or obovate, fibry. Nut bony with 3 pores at base.
3265. 1985n. Duvaひa. Calyx 4-cleft, persistent. Petals 4, concave. Stamens 6-10, inserted in the disk. Disk 8 -toothed. Ovary sessile, cunical, 1-ovulate. Styles 3-4, short. Stigma capitate. Drupe globose, containing a coriaceous nut. Seed pendulous.

20865 Glabrous, Lvs cordate-hastate with a deep broad sinus and rounded lobes on long petioles, Peduncles axillary solitary 1-flowered, Perianth unilabiate, Tube inflated at base striated, Limb ovate with reflexed sides reticulated above glandular, Glands large globose stipitate
20866 Glabrous, Lvs and stipules uniformly cordate, Flower large solitary, Perianth tube inflated obovate globose, Limb cylindrical at base bibabiate, Upper lip lanceolate acute densely pilose inside, Lower lip extended from a linear channelled base to a very broad reniform reticulated lamina
20867 Lrs on short petioles cordate acuminate, Stipules cordate-roundish, Peduncles axillary solitary l-flowered, Tube of perianth inflated at base dilated and oblique at the mouth
20868 Stem flexuous not twining nearly simp., Lvs on long petis, unifmly cord. obt. glauc. beneath, Pedunc. axil. sol. 1-flwd, Tube of perianth curved intla. at base, Limb unilat. rndsh obt. painted cil. with long gland. fishy hairs 20869 Glabrous, Lvs cordate acute, Flowers purple tessellate terminated by a short tail, in the centre leading to the throat is a rich spot of golden colour

\section*{Oriler 7. POLYANDRIA. Stamens more than 6.}
3266. 2005a. Ambrosinia. Spathe convolute at base and cucullate at top, and cuspidate. Spadix flattened; female in front at base, and male at top on back. Anthers usually 10, adnate to back of spadix. Pistil solitary, free, Ovarium subglobose, sessile, 1•celled. Style terminal, curved in towards the spadix. Stigma roundish. Capsule globose, depressed, sessile, 1-celled, indehiscent, many-seeded.
3267. 2005b. Arisa'ma. Spathe convolute at the base. Spadix naked at top. Anthers verticillate, on distinct filaments. Cells op \(+n\) by a transverse chink or pore. Ovaria numerous, free, 2 - 6 -ovulate. Style short, or wanting. Stigma capitate. Berry l- or few-seeded. Seeds globose, with a broad basilar hilum.
3268. 2005c. Cryptocóryne. Spathe or spadix inclosed or connate together at apex, or exserted, free. Male flowers very remote from the female flowers. Anthers at top of spadix, sessile, or shortly stipitate. Ovaria 6 or more in a whorl at the base of spadix, combined into one many-celled fruit. Styles distinct.
3269. 2005d. Peltandra. Spathe elongated, undulated, recurved at top. Spadix interruptedly androgynous. Sterile appendage short, naked. Anthers l-celled, verticillate, opening by a pore at apex. Ovaria numerous, scattered, 1-celled. Style short. Stigma subcapitate. Berry 3-4-seeded.
3270. 2005e. Xanthosoma. Spathe convolute at base, straight. Anthers 2-celled, verticillate. Cells contiguous, opening by chinks. Ovaria numerous, about 4-celled, cohering by the thick placeuta-formed styles. Ovula many. Stigma depressed, lobed, glutinous.
3271. 2005f. Acóntias. Spathe as in Xanthosdma. Spadix interruptedly androgynous. Anthers 2-celled, verticillate. Cells contiguous, opening by transverse chink at apex Ovaria many, about 3-celled, many-ovulate. Styles combined. Stigma minute, orbiculate, clammy.
3272. 2905g. Syngдnium. Spathe as in Xanthosdma. Anthers by fours or fives, 2 celled. Cells opposite, opening by pores. Qvaria numerous, connate, 1-celled, l-ovulate. Stigmas distinct, sessile, glutinous. Berries many, concrete, 1-seeded.
3273. 2005h. Culcàsia. Spathe straight, gaping, short. Anthers sessile, 2 from each dot. Ovaria numerous, crowded, free, l-celled, l-ovulate. Stigma sessile, capitate.
3274. 2005i. Philudéndron. Spathe convolute ât base, straight. Spadix continuous, androgynous. Anthers 2celled, distinct. Cells opening at top. Ovaria numerous, free, \(5-15-c e l l e d\) many-ovulate. Style short. Stigma capitate, or radiately lobed. Berries free, many seeded.
3275. 2005k. Spathicärpa. Spathe involute. Spadix adnate to spathe. Stamens numerous. Anthers 6-8, 1celled, opening by a pore in the middle. Ovaria numerous, free, 1-celled, 1-ovulate. Style elongated. Stigmas capitate. Berry 1-celled, 1 -seeded.
3276. 2co5l. Dieffenbachia. Spathe convolute. Spadix adnate to spathe; upper part male, free. Stamens numerous. Anthers \(3-4,2\)-celled, verticillate. Cells parallel, opening by a pore at apex. Ovaria numerous, free, l-celled, 1-ovulate. Stigma discoid, sessile. Berry 1-celled, 1-seeded.
3277. 2005 m . Antherùrus. Spathe gaping at base, convolute at apex. Spadix, the female part adnate to the spathe, sterile appendage filiform. Anthers numerous, crowded, coadunate, 2-celled. Cells opposite, opening by a transverse chink. Ovaria numerous, free, l-celled, l-ovulate. Style filiform. Stigma depressed, round. Berry 1-celled, 1-seeded.
3278. 2005n. Aglaonèma. Spathe gaping, convolute. Spadix continuous, androgynous. Anthers many, free, sessile, 4-celled, opening by a pore beneath the apex. Ovaria numerous, free, 1 -celled. Stigma discoid, sessile. Berries l-celled, l-seeded.
3279. 2005o. Homalonèma. Spathe gaping, Spadix androgynous. Anthers numerous, sessile. Ovaria numerous, free, 3 -celled, many-ovulate. Stigma sessile, trifid, concave.
3280. 2005p. Monstèra. Spathe gaping, deciduous. Spadix female at base, and pseudo-hermaphrodite at apex. Filaments flattened. Anthers 2-celled. Cells opposite, deliscing lengthwise. Ovaria-2-celled. Cells biovulate. Style short. Stigma capitate. Berries connate.
3281. 2005q. Scindápsus. Spathe gaping, deciduous. Spadix sessile, base female, top pseudo-hermaphrodite. Filaments cuneate, compressed. Anthers 2-celled. Cells divaricate, dehiscing lengthwise. Ovaria 1-celled, 1-2ovulate. Stigma sessile, oblong. Berries 1-seeded. Seed hooked.
3282. 2005r. Sauromàtum. Spathe tubular at base, with a flat spreading limb. Spadix interruptedly androgynous, rather clavate and naked at top. Anthers sessile, distinct. Cells dehiscing by a short oblique chink. Ovaria numerous, free, 1 -celled, biovulate. Stigma depressed, sessile. Berries 1 -seeded.
3283. 2005s. Dracunculus. Spathe convolute at base, with a flat spreading limb. Spadix androgynous, subclavate at top and naked. Anthers combined in clusters, 2 -celled. Cell opening by a short oblique chink. Ovaria numerous, free, 1-celled, 3-5-ovulate. Stigma depressed, sessile. Berries 1, few-seeded.
3284. 2005t. Pythonium. Spathe convolute at base, with an arched limb. Spadix androgynous, naked at top and tubercled. Anthers distinct, on short filaments, 4 -celled, dehiscing by 4 pores. Ovaria numerous, free, 1-celled, 1ovulate. Style subulate. Stigma valvately 3 -lobed. Berries 1 -seeded.
3285. 200 \(̀\) u. Amorphophállus. Spathe convolute at base. Spadix androgynous. Sterile appendage elongated, smooth or warted. Anthers distinct, on very short filaments, 2 -celled, dehiscing by a double pore. Ovaria numerous, free, 2-3-4-celled, ovate. Cells 1-ovulate. Stigma capitate, entire or lobed. Berries distinct, 1-or few-seeded.
3286. 2005v. Remusatia. Spathe convolute at base, with a refracted convolute limb. Spadix short, interruptedly androgynous. Stamens combined by twos or threes. Anthers 2 -celled, connate by the back. Cells verticillately disposed, opening by a longitudinal chink. Ovaria numerous, crowded, free, l-celled, many-ovulate. Stigma sessile, depressed.
3287. 2005w. Colocàsia. Spathe straight or cucullate. Spadix interruptedly androgynous. Sterile appendage clavate or acuminate. Anthers numerous, 2-celled, free. Cells contiguous, opening by a pore at apex. Ovaria numerous, free, l-celled, 6-7-ovulate. Style short. Stigma subcapitate.
3288. 2005x. Gonatanthus. Spathe convolute at base, with a lanceolate refracted limb. Spadix short, interruptedly androgynous. Stamens connate by threes. Anthers 2 -celled, adhering by the back, opening by a longitudinal pore-formed chink. Ovaria numerous, crowded, free, I-celled, many-ovulate. Stigmas sessile, depressed, orbicular.
3289. 2005y. Tiphonium. Spathe convolute at base. Spadix interruptedly androgynous, naked, and subulate at apex. Anthers distinct, 2-celled. Cells opposite, dehiscing lengthwise. Ovaria numerous, free, 1-ovulate. Stigma sessile, depressed. Berries 1 -seeded.

3290．20053b．Biarum．Spathe subulate at base，with a flat spreading limb．Spadix interruptedly androgynous， naked at top．Anthers sessile，crowded．Cells opposite，opening by a chink or pore．Ovaria numerous，free， 1 －ovu－ late．Style distinct．Stigma subcapitate．Berries 1 －seeded．

3291．2007a，Orania．Male and female flowers in different spathes，sessile，bracteolate．Spathes many，incom－ plete，－Male flowers with 3 sepals and 3 petals．Stamens many，filiform．Anthers linear．－Female flowers．Calyx of 3 sepals．Corolla urceolate，trifid．Ovarium 2 －celled．Stigmas 2，sessile，acute．Berry 2 －seeded．Seed flat on one side，and convex on the other．

3292．2007b．Iriártia．Flowers sessile，bractless：outer spathe incomplete，obliquely truncate at top；inner one complete，open lengthwise，－Male．Calyx of 3 concave sepals．Petals 3 ，erect，valvate．Stamens \(12-50\) ，rarely 6. Filaments short，terete．Anthers tetragonal．－Female．Calyx of 3 orbicular sepals．Petals 3，orbicular．Ovarum 3．celled， 2 of the cells abortive．Stigmas 3，sessile．Berry l－seeded，yellowish．

Order 8．MONADELPHIA．Stamens united into a single body．
3293．2009a．Desmóncus．Spadix girded by a double spathe；outer one short，inner one cylindrical．－Male flowers with a triangular trifid calyx and 3 petals．Stamens 6 ，from the bottom of the flower，filiform，with linear anthers， Female flower firmer than that of the male．Calyx cupular，truncate，or tridentate．Corolla urceolate，truncate，or tridentate．Ovarium 3 celled， 2 of the cells rudimentary．Style short．Stigmas 3，acute．Drupe ovate or subglo－ bose， 1 －seeded．Nut with 3 pores at top．

3294．2009b．Jubce＇a．Spathe simple．－Male flowers panicled，pedicellate．Calyx 3－parted．Petals 3．Stamens numerous，inserted in bottom of corolla．－Female flowers like those of the males．Ovarium 3－celled， 2 of which are small．Stigmas 3，spreading．Drupe ohovate，1－seeded．Nut with 3 pores at apex．
3295．2009c．Attalea．Flowers sessile，bracteate；upper ones male，lower female．－Male flowers of 3 sepals and 3 petals，Stamens \(10-24\) ，crowded．Female flowers of 3 sepals and 3 petals．Ovarium \(3-\) rarely \(4-5\)－and more rarely 2－celled．Stigmas as many as there are cells，subulate，connivent．Drupe elliptic，fibry，containing a \(2-3\)－celled nut． Cells porose at base．
3296．2009d．Manicaria．Flowers，lower female，upper male，bracteate．Spathe simple，fusiform，reticulated． Male．Sepals 3，scarious，ovate－suborbicular，imbricate．Petals 3，coriaceous，oblong．Stamens 24－30．Anthers linear－sagittate，erect．－Female．Sepals 3，scarious，ovate，imbricate．Petals 3，coriaceous，oblong－lanceolate．Ru－ dimentary stamens about 12．Ovarium turbinate，trigonal，furrowed or angular，3－celled．Stigmas 3，sessile ovate－triangular，at first erect but at length spreading．Drupecontaining 3 nuts，rarely \(1-2\) nuts by abortion，corky， angularly echinated．Nut crustaceous，covered with reticul．ted fibres，with a hole at bottom．
3297．2009e．Arénga．Flowers sessile，bracteate．Spathe complete．Calyx 3－sepaled．Petals 3．Stamens indefi－ nite．Anthers cuspidate．－Female flowers．Ovarium 3－celled．Stigmas 3，conical，connate at base．Drupe containing 2－3 trigonal nuts．
3298．2009f．Cyclanthus．Flowers surrounding the spadix in a spiral manner：the male series alternating with the female series．Spathe 4－leaved，imbricate．－Male fowers earliest．Stamens numerous，free，filiform．Anthers oblong，4－celled，dehiscing lengthwise．－Female flower．Ovaria numerous，within a double lamina，and surrounded by the spathe，biseriate，sessile，l－celled，many－ovulate．Style short．Stigma spatulate．Fruit fleshy，spiral，many－ seeded．

3299．2011a．Dámmara．Flowers diœcious，terminal．－－Male ament extra－axillary．Stamens numerous，inserted on the axis，imbricate，short，drawn out into a thick connate connective．Cells of anther 8－15，cylindrical，free．－ Female ament terminal，nearly ovate．Scales bractless，imbricate．Orulum solitary under the scales．Strobile ovate－ globose，imbricate．Seed ending in a wing at both ends．

\section*{History，Use，Propagation，Culture，}

3249．Pástia is composed of floating water－plants，nearly related to Lémna．The species cnly require to be thrown into water in a stove．Plenty of heat is requisite．They are singular plants，and one species has become very common
3300. 2013a. Cèdrus. Almost the game as Larix; but having the carpels separating from the axes, and the leaves evergreen. Cones erect, large, solitary. Anthers terminated by an elliptic scabrous crest. Carpels coriaceous, compressed, deciduous.
3301. 2018a. Cállitris. Male catkin terminal, ovoid. Stamens numerous, naked, Filaments peltate, loosely imbricate. Cells of anthers 2-5, longitudinally 2-valved, inserted in the stipe under the pelta. - Female receptacle terminal, very short, girded by 4-5 scales. Ovula 3-9, at base of scales, sessile, erect, open at top. Cone formed of woody, mucronate, connivent scales, which separate into 4-6 valves. Seed drawn out into a wing at both ends.
3342. 2018b. Phyllócladus. Flowers terminal. - Male catkin spike-formed, girded by imbricate bracts at base. Stamens numerous, short: the connective drawn out into a lacerated scale. Anthers 2-celled. Cells adnate to the connective, dehiscing lengthwise. Female catkin nearly globose, imbricate by bracts. Flowers terminal by threes : middle one abortive. Disk cup-shaped, fleshy, girding the ovulum, which is sessile and attenuated at apex, obliquely pertuse. Fruit subdrupaceous, pervious at top. Seed nut-formed, erect.
3303. 2018c. Widdringtonia. Female receptacle termioal, reflexed, of 4 similar valvatelg-verticillate scales, with 4-5 ovula at the base of each scale. Ovula erect, disposed in one or two series, pertuse at apex. Strobile subglobose, 4 -valved. Valves equal, 5 - 10 -seeded. Seeds ending in a wing at both ends.
3304. 2018d. Saxgothe'a. Anthers of male flowers spicate. Female cones imbricate. Scales acuminate, monospermous below the middle. Seed nucumentacous, triangular.
3305. 2018e. Frenela. Male catkin terminal, ovate-subglobose. Stamens numerous, ternately verticillate, imbricate, in 6 rows. Filaments short, prolonged into a scale-formed, excentric, peltate connective or process, bearing each 4 horizontal, longitudinally 2 -valved cells. - Female catkins solitary, terminal, or panicled, composed of 6 scales; alternate ones narrower. Seeds many, at base of scales, in many series. Cone subglobose, 6 -valved, woody. Seeds numerous, wingless.
3306. 2018f. Fitzróya. Male flowers unknown. Female catkin solitary, sessile, globose, terminal. Scales 6, inserted by 2 series: the lower 3 ovate-orbicular, thick, coriaceous, with a short spine above the middle on the back, 3 exterior, smaller, more spreading and abortive ; the inner ones erect, bearing ovula. Ovula 3, at the base of each scale. Fruit like a cone. Seeds orbicular, subbilobed, ciliately compressed.
3307. 2018g. Cryptomeria. Male catkin spicate. Antheriferous scales roundish, adpressed, imbricate. Cells of anthers 5 , connate, altogether adnate to the base of the scales, dehiscing by a broad foramen in front. Ovula erect. Cone solitary, globose, squarrose, composed of 3-6-toothed scales. Bracts acuminated, lanceolate, concrete at base, Seeds 1-6, compressed, angular, hardly winged.
3308. 2018h. Libocedrus. Male catkin cylindrical, terminal. Stamens 5-7. Filaments short, prolonged into a scale-formed, deltoid, peltate process, bearing 4 cells on the lower margin. - Female catkin solitary, terminal. Gemmiferous scales 4, verticillate, mucronate beneath the apex. Cone 4 -valved, alternate. Valves smaller, 1 -seeded. Seed unequally winged at both ends.
3309. 2018i. Biota. Male catkins ovoid, terminal. Stamens inbricate, in four rows. Connective peltately orbicular, mutic, with \(3-4\) horizontal cells.- Female catkins solitary, terminal. Gemmiferous scales 6-8, broad, decussate, opposite, sessile, mucronate, imbricate ; inner ones sterile. Scales of cone coriaceous, 2 -seeded. Seeds with a wing at both ends.
3310. 2032a. Codičum. Male. Calyx 5-parted, reflexed, convolıte in æstivation. Petals 5 , scale-formed, shorter than calyx, and alternating with as many glands. Stamens numerous, hypogynous. Cells of anthers adnate to the rather dilated connective on both sides.-Female. Calyx 5-cleft. Corolla none. Ovarium girded by 5 hypogynous scales at base, 3-celled, 3-ovulate. Styles 3, filiform, reflexed. Berry dry or subbaccate, tricoccous. Coccus 1-seeded.

\section*{DIANDRIA.}

20970 Leaves roundish-obcordate with wavy margins, Lamellæform nerves confluent in a basilar truncate area 20871 Leaves oblong-obovate retuse, Lamellæform nerve confluent in a large basilar area

20872 Leaves lobed, Flowers axillary

\section*{TRIANDRIA.}
[acute, Fruit roundish-ovate compressed with a very short entire beak, Nut elliptic triangular, Leaves flat
20873 Fertile spikes \(2-3\) upon long stalks oblong dense-flowered, Bracts auricled foliaceous, Glumes ovate-lanceolate 20874 Barren spikes 1-2 slender acute fertile, 2-3 ovate-obtuse, lower one stalked bracteate sheathless, Fruit oblong-ovate nerved inflated narrowed into a short bifid beak, Glumes acute
20875 Fertile spikes erect remote \(3-4\)-flwd pedunculate. Bracts sheathing leafy, Glumes acute, Fruit large nearly globose with a long bifid beak and rough edges, Nut elliptic trigonal with bluntish angles
20876 Spikes panicled, Lower branches rather distant, Fruit ovate ribbed at base, Beak bidentate serrulated, Nut rhomboid convex on both sides with a short beak, Stem trigonal scabrous at top
20877 Fertile spikes 1-3 ovate near together sessile, Bracts small membranous the lowest with an awl-shaped point, Glumes of fertile spikes notched and inuc., Fruit narrow below obl.-obov. trig. with a short notched beak
20878 Spikes l-4 roundish or oblong continuous nearly sessile, Fruit ohovate triquetrous scabrous above with a short beak, Nut obov. triq. blunt with a short beak, Bracts length of spikes, Stem triang. rough towards the top
20879 Spikelets several, upper ones simple crowded, lower ones distant composed of alternate spicula, Nut lanceolate plaon-convex with an entire beak, Lower bracts longer than spike
20880 Fertile spikes remote with distant flowers on exserted stalks, Bracts sheathing scarcely leafy, Glumes bluntish, Fruit ovate triquetrous glabrous with a short truncate beak, Nut elliptic triangular beaked
20881 Barren spike solitary, fertile ones 2-4 oblong slightly stalked, Bracts leafy, Fruit longer than glume lanceolate entire beaked many-nerved, Nut obovate rounded at end and shortly beaked
20882 Spikelets 4-8 ovate or oblong approximate, Fruit erect ovate plano-convex, Beak short split to the base rough on edge, Nuts elliptic, Glume ovate shorter than fruit
20883 Spikelets 3-4 roundish-elliptic contiguous, terminal one longer, Fruit erect elliptic acuminate plano-convex with smooth edges, Nut elliptic tipped with the persistent style, Glumes ovate as long as fruit

20884 Leaves oblong acute bluntish at base clothed with fine fuscescent down beneath
20885 Leaves ovate-oblong acuminate serrulated
\(\beta\) Leaves much cut almost palmate, Lobes deeply toothed, Middle lobe long acuminate
20886 Leaves soft round heart-shaped
in our hothouse aquaria. In tropical countries the ponds and pools are densely covered with either one ur other of the species of Pistia. It is doubtful whether they are not all merely varieties depending upon climate.

History，Use，Propagation，Culture，
20888．Bétula Bhojpittra．The epidermis of this tree is used by the mountaineers in the Himalaya instead of paper for writing upon．It is of a very delicate texture，and peels off in large masses，of which great quantities are brought down into the plains of Hindostan，where it is employed for covering the inside of the long flexible tubes of the hooka used for smoking．The Sanscrit name of the substance is Bhoorja，the Bengalee name is Bhoorjapattra，and the Hindostani name is Bhojpattra．

3250．Fortune＇a chinensis．A hardy tree，of as easy culture as the walnut．
325i．Holböllia．The natives of Nepal eat the fruit，the pulp of which has a sweetish，but otherwise insipid，taste． The species flower very well trained against a wall，without any other protection．

3252．Akebia quinata is a very pretty climber while in blossom．In China it grows in hedges，and there it climbs on other trees，and hangs down in graceful festoons from the ends of their branches．The colour of the flower is dark brown，and it is very sweet－scented．It succeeds very well trained against a wall or trellis，and is perfectly bardy

20887 Leaves very large
20888 Leaves oblong acute serrated rather cordate at base having the stalks and veins hairy beneath, Branchlets hairy, Female catkins erect, Bracts smooth 2-parted obtuse longer than narrowly winged fruit
20889 Arboreous, Leaves alternate on short petioles obliquely oblong cuspidate serrated roughish, Male flowers panicled, female ones capitate, Heads on short pedicels baccate in the fruit-bearing state

\section*{TETRANDRIA.}

20890 Leaves pinnate with 4-5 pairs of ovate-lanceolate biserrated leaflets and an odd one

\section*{HEXANDRIA.}

20891 Leaves ternate or quinate coriaceous, Leaflets oblong obtuse mucronate, Peduncles longer than petioles 20892 Leaves ternate or quinate coriaceous, Leaflets oblong-lanceolate acuminate, Peduncles shorter than petioles, Sepals acute

20893 Leaves ternate or quinate, Leaflets ovate or obovate entire obtuse or emarginate mucronately setaceous
[Female flowers ovate-globose, Drupe obovate-elliptic 20894 Caudex dwarf annulate at base, Fronds short with approximate lanceolate pinnæ, Petals of male flowers thick, 20895 Caudex flexuous scaly from the bases of the fallen leaves, Fronds spreading, Pinnæ loose curled distantly aggregate linear, Female flowers oblong angular, Drupe oblong beaked
20896 Caudex and rachis glabrous beset with long terete prickles, Pinnæ nearly opposite or scattered lanceolate subfalcate ciliated, Spathe densely imbricate by compressed shining prickles, Spadix branched
20897 Caudex prickly, Petioles sheathing at base prickly, Rachis glabrous prickly behind and unarmed in front, Pinnæ scattered deltoid cuneated præmorse with a longer marginal tooth on each side unarmed clothed with silvery tomentum beneath, Spathe prickly, Spadix bristly branched, Drupe turbinate globose
20898 Caudex reed-like unarmed, Sheaths of petioles prickly, Rachis nearly unarmed, Pinnæ pectinate linear falcately acuminate pilosely ciliated, Spathe prickly, Spadix \(2-5\)-cleft, Drupe globose unarmed glabrous
20899 Caudex tall glabrous as well as rachis but prickly, Prickles large compressed, Pinnæ subaggregate falcate-lanceolate or oblong-cuspidate ciliated, Spathe prickly, Spadix branched, Drupe globose glabrous unarmed

20900 Pinnæ linear acuminate same colour on both surfaces, Outer fibres of berry free and filiform
[hairs, Bracts of male @ws hairy, Calyx ciliately multifid, Female fiws sessile, Drupes obovate beaked bristly 20901 Very prickly, Pinnæ narrow-lanceolate acuminate silvery beneath, Peduncle of spadix beset with turned back 20902 Very prickly, Pinnæ lanceolate subfalcate silvery beneath, Bracts of male flowers smoothish, Female flowers nearly sessile, Calyx glabrous shorter than hairy corolla, Drupe pear-shaped spiny
20903 Tall, Pinnæ lanceolate acuminate silvery beneath, Bracts of male flowers ciliated, Calyx of female flowers haily urceolate exceeding the glabrous corolla, Drupe globose unarmed
20904 Stemless, Pinnæ narrow-lanceolate acuminate paler beneath, Bracts of male flowers penciled on back, Calyx entire, Female flowers pedunculate, Calyx and corollas equal glabrous, Drupes globose unarmed
20905 Stemless, Pinnæ linear subfalcate white beneath, Bracts of male flowers ciliated, Calyx fringed, Female flowers with glabrous equal calyxes and corollas, Drupes obovate beaked unarmed
20906 Pinnze lanceolate acuminate white beneath, Bracts of male flowers ciliately villous on the back, Calyx nearly entire, Female flowers pedunculate, Calyx and corollas equal glabrous, Drupe ovate unarmed
20907 Pinnæ linear præmorse paler beneath, outer ones connate, Female towers sessile prickly, Drupe subglobose unarmed
20908 Petioles of fronds prickly or bristly, Pinaæ linear-lanceolate downy beneath rather glaucous, Drupes globose

\section*{and Miscellaneous Particu'ars.}
3253. Leopoldina pulchra is a middle-sized palm tree, with a fibry caudex, and pinnate unarmed leaves. The spadix is paniculately branched, and covered with rusty tomentum, as well as the bracts and bracteoles. The flowers are small and reddish. The culture is the same as for other tropical palms.
3254, Astrocaryon is a genus of middle-sized palm trees, some of which have stems, and some without, which are beset with strong dark prickles. The fronds or leaves of all are pinnate and ciliate with prickles. The spadix is simply branched and prickly, usually white from tomentum. The spathes are woody and also prickly. Flowers dense. Drupe yellow or orange.
3255. Acrocomia is a genus of gigantic palm trees. The caudex or stem is usually swollen in the middle, and prickly. The fronds or leaves are pinnate, and curled. The petioles and spathes are prickly. The spadix is simply branched.
The fruit is olive brown.

History，Use，Propagation，Culture，
3256．Enocarpus is a genus of gigantic pirm trees，with annulate soft stems and pinnate curled fronds．The spadix rises beneath the fronds，and is fastigiately branched and broom－formed，and the branches are covered with granular brown tomentum．The spathes are double and woody．The drupes are globose and pruinose．
3257．Wallichia is a genus of small East Indian palm trees，with pinnate fronds and præmorse cuneate pinnæ．The spadix is simply branched，and the branches are pendulous．The flowers are small and cream－coloured，and the berries are brown and dry．
3258．Martinèsia caryotafolia is a tall palm tree，with roots issuing from the candex，which is prickly．The fronds are pinnate，and the pinne are cuneiform，obsoletely 3 －lobed，alternate，and having a prickly rachis．The petioles are also beset with straight twin prickles beneath．The spathes are ovate，and also prickly．The spadix is prickly， with Hexuous branches．The fruit is reddish yellow．
3259．Oncospérma filament \(\begin{gathered}\text { sum } \\ \text { is an elegant palm tree，growing in humid places by the sea shore．The stem is }\end{gathered}\) hall，slender，and prickly．The fronds are terminal and pectinately pinnatifid，and the segments are conduplicate． The fruit is small and globose．
3260．Syagrus cocoides is a middle－sized palm tree．The frouds are terminal and loosely pinnate．The spadix is simply branched．The spathe is sulcate on the back．The flowers are rather larger and cream－coloured．The fruit is dry，and of a yellowish green colour．
3261．Euterpe oleracea is a beautiful palm，with pectinately pinnate fronds．The spadix is branched and scurfy

20909 Caudex naked, Fronds scattered, Pinnæ linear-lanceolate, Calyx of male flowers 4 times shorter than the acutish petals, Segments ovate-triangular, Berries ovate-elliptic obtuse
20910 Caudex subterraneous, Pinnæ cuneate præmorse, Branches of spadix drooping, Berry ovate-oblong dry
20911 Almost stemless, Pinnz white beneath, the lower ones rising in twos, the rest solitary linear-oblong cuneated, at base entire, the rest spinosely toothed or erosely serrated, Fenale flowirs dense

20912 Caudex prickly, Pinnæ wedge-shaped 3 -lobed and erose, Rachis prickly, Petioles prickly, Spathe ovate prickly, Branches of spadix simple flexuous

20913 Caudex tall slender, Fronds terminal pectinately pinnatifid, Segments reduplicate acuminate, Petioles sheathing a great way at base, Spadix solitary under the leaves simply branched at top, Branches fastigiate pendulous
20914 Caudex annular below, Fronds pinnate, Pinnæ linear narrow curled a little, Drupes obovate elliptic

20915 Fronds pinnate pectinate, Flowers dense covering all parts of the branches of spadix, Sepals of male flowe rs broad-ovate denticulated, Petals lanceolate not so long as sepals
20916 Leaves elliptic-obovate, Pinnæ quite entire lanceolate spreading tapering to apex, Petioles unarmed lepidoted beneath, Floriferous branches of spadix spreading much, Flowers loose by pairs, Fruit roundish

20917 Caudex middle-sized crowned by the vestiges of the fallen leaves, Anthers exserted double the length of petals, Female towers some in each branch
[Flowers imbricate in 4-5 rows, Calyx and corollas of male flowers equal, Berries nearly globose 20918 Fronds terminal lanceotate tapering at base bifid at top sometimes irregularly pinnate cut, Spadix branched, 20919 Stemless, Fronds lanceolate cuneate at base bifid at apex, Spadix radical simple cylindrical, Cor, of male flowers exceeding the calyx, Berries ovate
[long as the corollas
20920 Stemless, Fronds pinnate, Pinnæ lanceolate, Spadix radical simple cylindrical, Calyx of male flws not half so 20921 Fronds terminal pinnate, Pinnæ præmorse, Spadix branched downy, Flowers imbricate in 4-5 rows, Male flws with equal calyxes and corollas, Berries globose
20922 Fronds terminal undivided lanceolate cuneated at base bifurcate at top, Spadix panicled downy, Flowers imbricate in 6-8 rows, Male flowers with the calyxes about equal to corolias, Berry ovate-globose
20923 Fronds terminal pinnate, Pinnæ linear approximate, Spadix panicled with elongated tomentose branches, Female flowers solitary, Berries ovate

20924 Stemless, Fronds loose curled, Pinnæ linear glaucous beneath, Drupe obovate pentagonal
20925 Stemless, Fronds split, Pinnæ stiff lin. glaucesc. beneath, Male flwrs hexandr., Anthers obt., Drupes ov. glob. 20926 Caudex middle-sized, Fronds rather curled, Pinnæ linear long acum. silvery beneath, Male flowrs polyandrous

20927 Leaves linear-oblong narrowed at base quite entire, Corymbs sessile axillary, Flowers 7-8-androus
20928 Leaves ovate-lanceolate entire and sometimes trifid, Racemes length of leaves, Flowers octandrous
20929 Leaves lanceolate toothed, Racemes compound a little longer than leaves, Flowers decandrous
2093 Leaves ovate toothed acute or obtuse, Racemes axillary and a little longer than leaves, Flowers usually octan20931 Leaves ohlong coarsely toothed wavy acute, Racemes dense about equal to leaves, Flowers hermaphrodite

and Miscellaueots Particulars.
The spathe is double : the outer one short and open at top; the inner one open all its length. The flowers are sessile, and the fruit dark purple.
3262. Maximiliana regia is a showy mildle-sized palm tree. The fronds are pinnate, and the pinnæ are aggregate. The spathes are persistent. The spadix is simply branched. The fowers are compact. The drupe is brownish.
3263. Geónoma is a genus of small reed-like pilms. The stems are slender, annulate, and smooth, rarely wanting. The fronds are either simple or pinuate. The petioles are sheathing. The spadixes are spicate, and very often panicled. The berries are ovate, or nearly globose, spiny, of an obscure colour, rather fleshy, hut insipid.
3264. Diplothemium is a genus of Brazilian palms usually stemless. The fronds are pinnate, on short petioles. The pinnæ are stiffy spreading or curled and interruptedly aggregate. The spadix is simple, bearing the flowers in front. The outer spathe is biddell among the leaves. The flowers are large and cream-coloured. The drupes are
yellowish, and the flesh is fibrous but edible. yellowish, and the flesh is fibrous but edible.
3265. Duvaúa is a genus of half-hardy shrubs or trees. They would probably stand in the open air in Devonshire without injury. They require only common treatment, and may be increased by layers or cuttings. The same phenomenon in the leaves as that in those of Schinus Molle. After lying a short time in the water, they will begin to start and jump, as if they were alive, while at the same instant of each start a jet of oily matter is discharged into the
water. The D. Latifolia is called Huingan in Chili.

20937 Root tuberous, Stem scandent radicant, Leaves roundish-ovate obsoletely toothed glabrous shining, Petals serrated, Peduncles 2 -flowered largest wing of capsule obtuse-angled the rest parallel small
20938 Leaves large palmate oblique at base, Stipules oblong cuspidate keeled Male flowers with 4 sepals 2 small and 2 large, Female flowers with nearly equal pe:als, Kacemes axillary, Peduncles long
20939 Stemless, tuberous, Leaves peltate ovate acute entire glabrous above ciothed with rusty tomentum beneath, Wings of capsule 2 roundish and 1 large and obtuse
20940 Creeping, Leaves ovate acute unequally cordate muricated above and downy beneath, Wings of capsule parallel 20941 Rhizoma creeping, Leaves cordate 7 -lobed unequally toothed setosely ciliated pale beneath with reddish mar gins, Petioles pilose, Pets 2 rose-clrd dotted with scarlet, Cap. 3-winged one of which is large and rose-clrd
\(\beta\) Stemless, Leaves palmate pilose as are the tall scapes and petioles, Leaves 7 -lobed, Lobes lanceolate-oblong wavy sinuated, Flowers dipetalous, Filaments cohering at base, Wings of fruit roundish
20942 Stems short thick short-jointed a little tortuous, Leaves obliquely ovate short acuminate many-nerved entire studded with numerous fascicles of setæ, Petioles as long as leaves beset with fringed depressed scales, Stipules ovate concave dry setose, Peduncles longer than petioles beset with similar scales
20943 Leaves deeply palmate, Segments acuminate subpinnatifid deeply-toothed covered with rusty hairs beneath, Stem short fleshy articulated unequal creeping, Panicles dense many-flwd covered with rusty down, Flowers dipetalous glabrous as are the bracts, Sepals roundish, Wings of fruit unequal, upper angle rounded
20944 Downy, Stem thick short creeping scaly, Leaves petiolate roundish-cordate much longer than the axillary peduncles, Flowers racemosely panicled all dipetalous, Wings of capsule nearly equal
20945 Stem simple nodose muricated, Lvs alternate digitate of 5 or 7 lanc. acum. uneq. ser. leaflets which are shining and glandularly muricated on both surfaces, Petioles terete, Stipules none, Cymes axillary dichotomous on long peduncles, Flowers diœcious, male ones 4-leaved, Leaflets equal reflexed in 2 series
20946 Leaves digitate about 10, Leafets lanceolate unequally serrated scabrous, Wings of capsule roundish equal
20947 Stemless downy pilose, Leaves on short petioles obliquely cordate sinuately lobed serrated wrinkled deeply 2 lobed at base, Lobes rounded imbricate, Scape much longer than leaves thick paniculately branched, Flowers showy, Pets 5 obov., Fruit turbinately triq., 2 of the angles with narrow wings, the third with an elong. wing
20948 Stems fleshy covered with rusty down, Leaves on long petioles concave obliquely ovate coarsely and deeply toothed glabrous above and downy beneath, Panicles axillary covered with rusty tomentum, Bracts roundishovate convex, Flowers dipetalous glabrous, Wings of fruit emarginate nearly erect
20949 Covered with brown hairs, Leaves unequally cordate palmately lobed, Scape 3 -flowered, Capsule villous with obtuse-angled wings one of which is prolonged
20950 Much branched glab., Lvs unequally cord lobed acute bluntly toothed shining pale beneath with col. veins, Male flws dipetalous, Female 5-petaled uneq., Peduncs bifid with 2 -flwd branches, Wings of cap, nearly equal acute
20951 Arborescent, Leaves unequally reniform angularly lobed serrated hairy, Cymes dichotomous, Perigone downy, Wings of capsule 2 very narrow and the third large and acute-angled
20952 Suffruticose dichotomously branched glabrous, Leaves on long petioles semicordate 5-6-cleft acute sharply serrulated rather hairy, Peduncles terminal elongated dichotomous
20953 Stemless, Leaves obliquely ovate obtuse subreniformly peltate fleshy lobately sinitated glabrous, Petioles hairy, Two outer sepals scarlet roundish, the rest smaller and whiter, Cap, turbinate 3 -winged, Wings broad uneq.
2: 954 Caulescent erect hoary tomentose, Leaves coriaceous peltate oblong acute subangular white beneath, Panicle small contracted, Male flowers 4 -petaled downy, Female unknown
20955 Stem fleshy nodose, Leaves unequal-sided reniformly cordate angularly serrated glabrous shining, Peduncles axiliary dichotomous few-flowered, Wings of capsule nearly equal, 2 roundish, the third acute-angled
20956 Leaves oblong cucullate denticulated glabrous, Stipules oblong-toothed, One wing of the capsule is large acuteangled, the rest parallel

Ltuse, the third large and acute
20957 Suffruticose, Leaves unequally reniform clothed with rusty tomentum beneath, two of the wings of fruit ob-
20958 Lvs oblong acuminated angular serrated glabrous, Petioles thickened, One wing of capsule large obtuse-angled, the rest acute-angled
20959 Caulescent, Leaves ovate-oblong unequally cordate acuminate denticulate rather angular outside at base, Cymes on short peduncles extra-axillary, Capsule tetragonal
20960 Shrubby erect, Leaves nearly sessile unequally oblong-cordate undulately repand entire glabrous shining, Cymes dichotomous, Wings of capsule rounded equal
20961 Shrubby erect-branched, Leaves on short petioles oblique at base almost equally elliptic-lanceolate giabrous shining glaucescent beneath toothed, the teeth setose at apex, Cymes axillary few-flowered shorter than the Ivs, Petals nearly equal ovate-oblong, Dorsal wing of capsule large dotted acute, the rest almost wanting
20962 Shrubby erect, Leaves lanc. unequal-sided acum. subcordate at base with crested margins glabrous and shining 20963 Subherbac., Lvs semicord, uneq. toothed glab., Stips reticu. with veins, Wings of cap. roundish nearly equal

History, Use, Propugation, Cullure,
1997. Fagus antárctica and F. betuloides form a predominant feature in the Fuegian landscape. The leaves of the first resemble those of our common berch, and are deciduous; but the \(F\). bctuloides if evergreen, and is the antarctic

20964 Tall, Lvs obliq auricled at base obsoletely sinuated hoary tom., Peduncs elong. downy, Panicle simple manyflwd, Male flwr 4-petaled, 2 roundish and 2 smaller obl., Female flwr of 2 obov, pets, Wings of cap. nearly eq. 20965 Caules., Lvs obl. ac. unequally cordate ser. glabrous shining, Stipules ov. ent., Male flws 4-petaled
20966 Shrubby, Leaves long semicordate acummate repand spotted with white above red beneath, Wings of capsule roundish nearly equal
20967 Shrubby erect, Leaves semicordate doubly serrated ciliated, Cymes nutant ditrichotomous, Two of the wings of capsule narrow, the third large and bluntly triangular
20968 Shrubby erect, Leaves unequally cordate acuminate shining hairy rather rough, Cymes dichotomous, Wings of capsule nearly equal
20969 Leaves obliquely oblong-ovate acuminate fleshy sinuated serrated red on the margin, Stipules large obovate concave coloured deciduous, Panicle nutant, Flws deep scarlet, Male Aws of 4 roundish petals 2 of which are small, Female flws of 5-6 nearly equal ovate petals, Capsule pear-shaped with equal wings
20970 Glabrous fleshy, Scem woody decumbent, Leaves obliquely cordate repandly toothed acuminate with purple filamentose scales on nerves ben. and on margins, Petioles girded by a mass of connate scales at apex ciliated, Cymes large dichotomous on long peduacs, Nale and female flws both dipetalous, Wings of capsule nearly eq.
20971 Scandent, Leaves oval unequal-sided subangular serrulated plicate hairy, Cymes dichotomous, 2 of the wings of capsule very narrow and the third large and acute-angled
20972 Erect-branched smooth, Leaves semiovate obliquely falcate acute serrated ciliated, Panicle pendent, Male flws of 4 conniving petals, 2 outer ones largest and boat-shaped, Female flowers of 5 conniving petals, Pedicels triquetrous, Third wing of capsule much larger than the rest
20973 Fleshy branched humble, Stem setosely scaly, Leaves on loug bristly petioles deeply cordate roundish 7 -nerved repand entire scabrous above pilose on nerves beneath, Stipules cordate, Peduncles terminal corymbosely few-flowered nutant, Third wing of capsule subdeltoid roundish, the other 2 smaller
20974 Erect scabrous, Root fibrous, Leaves palmate or 3-lobed biserrated, Peduncles terminal and axillary. Flowers of 2 roundish-ovate biserrated petals and 2 smaller subcuneate toothed ones glabrous, Capsule villous
20975 Leaves striped like the Zebra. This species is not sufficiently known.
20976 Stemless, Lvs all radical aggregate on long petioles obliquely roundish-ov. short acum. glandularly ser. peltate conc. purple beneath, Scapes longer than ivs dichotomously corymb. at apex, Pedicels nutant, Male fws of 4 seps 2 of which smaller, Fem. fiws of 3 seps 1 of which is small, One wing of fruit larger than the other two
20977 Stemless, Rhizoma short rooting, Leaves large obliquely cordate-ovate short acuminate crenately denticulated red beneath on thick bristly stipulate petioles the lower bristles rellexed, Scape twice as long as leaves, Flws nutant corymbose yellow, Male ones of 4 oblong-cuneate sepals one of which is larger and more concave, Female flowers small of 6 equal oblong sepals, One wing of iruit horizontally elongated and striated
20978 Stemless, Rhizoma creeping, Lvs semipeltate concave obliquely ovate angularly toothed acuminate rounded at base shining above white beneath and covered with rufous tomentum on the nerves, Petioles and dichotomous scapes coloured and covered with rufous tomentum, Flowers dipetalous, Female ones bibracteate, Wings of capsule roundish, 2 narrower green, the third a little broader crenulated and coloured
20979 Stemless, Rhizoma creep., Lvs obliqly cord. margined with red angularly toothed acum. covered with coloured scales which are usually bipartite and flamentose at top on the nerves beneath and on the margin as well as scapes, Cymes dichot., FIws dipet., Two wings of cap. obt, -angled, the third a little broader ac.-ingled
20980 Stemless, Lvs nearly regular on long petioles cord. ac. obscurely lobed creuately ser. greenish purple blotched with white and beset with purple hairs as are the petioles, Stipules ov. acum., Scapes numerous shorter than petioles, Flws subumbel. of 4 sepals, Capsule triquetr. with short roundish nearly equal doubly culi. angles
20981 Glabrous, Stem short, Leaves on long petioles obliquely ovate acuminate unequally dentate serrated with white blotches above purple beneath, Stipules large acuminate, Peduncles axillary exceeding the petioles, Flowers corymbose, Petals 4, 2 outer ones largest painted with red veins, the 2 inner ones white, Two of the wings of the fruit short and roundish, third horizontally elongated elliptic obtuse
20982 Caulescent, Leaves stalked obliquely ovate acuminate subcurdate at base glossy rather hairy on margins, Panicle dichotomous drooping, Outer sepals roundish-ovate inner ones shorter and narrower, Female flowers of 5 nearly equal oblong sepals, Wings of fruit unequal
20983 Lvs obl.-ov. obt. rather obliquely trunc. unequally dent. ser. minutely reticu. beneath when young plicate, Cupula invol.-frind deeply 4-parted, Segs uneq. ent. with a series of fringed scales on back, Nuts cili. at top
20984 Lvs ovate-elliptic obtuse crenulate coriaceous shining glabrous rounded at base on short petioles, Male perianth solitary turbinate \(5-7\)-lobed \(10-16\)-androus, Cupula involucre-formed with marginate angles, Branches covered with a resinous varnish. More the habit of a hornbeam than a beech
20985 Leaves ovate-oblong oblique subrhomboid obtuse doubly serrated entire at base tapering into the petiole rather pilose, Male perianth solitary heraispherical sinuated \(30-40\)-androus, Cupula capsule-formed muricated 4 -parted, Seginents ovate obtuse, Ovaria enclosed triquetrous, Angles winged
20986 Lvs deltoid coriaceous coarsely and unequally toothed obsoletely nerved, Cupula capsule-formed at length deeply 4-parted, Segments lanceolate beset with soft spines tipped with glands
[with stellate down above
20987 Brachs petis and under side of lvs densely tomentum, Lvs cord.-ev. aristately toothed ac. cinerous and covered 20988 Les ovate-lanceolate acuminate subcordate at base covered with powdery tomentum rusty beneath sinuately toothed, Teeth elongated cuspidate, Fruit by twos or fours on short peduncles
20989 Branches rather downy, Leaves nearly sessile obovate cordate remotely toothed coriaceous rugose finely tomentose beneath, Fruit twin on long peduncles, Cupula cyathiform

und Miscellanevus Particulars.
evergreen beech. They are buth qu te hardy, and grow to trees of large size. The Van Diemen's Land Beech is a
fine evergreen tree, with coarsely tuothed leaves. The wood is value fine evergreen tree, with coarsely tuothed leaves. The wond is valuable and close grained.

History, Use, Propagation, Culture,
3266. Ambrosinia Bässii has a tuberous-branched rhizomatose root and cordate-elliptic entire leaves, and the scapes rise from among the petioles. The cuiture is the same as for the tropical species of A'rum.
3267. Arisa'ma is composed of tuberous-rooted plants like those of \(A^{\prime} r u m\), and should be treated like the tropical species of that genus.
3268. Cryptocóryne. Marsh plants with tuberous stoloniferous roots. The leaves are entire, petiolate, and feather-nerved; the inflorescence solitary and nearly sessile at the base of the petioles, or on a more or less manifest scape. The flowers are sweet-scented. The culture of the species is the same as that of the tropical species of \(A^{\prime}\) rum.
3269. Peltándra virgínica has rhizomatose tuberous roots and sagittate nerved leaves. The scapes are solitary and elongated, and rise from the sheath of the petioles. The culture is the same as for the other hardy species of A'rum.

20990 Branches tuberc., Lvs on short petioles oblong-lanc, acum. mucronate rounded at base entire coriac. clothed
with cinereous toment, beneath, Fruit pedunc. usually twin, Yeduncs thickened, Cupula rather turbinate
20991 Branches tomentose, Leaves elliptic obtuse cordate remotely and bluntly toothed membranous tomentose beneath, Fruit on long peduncles subspicate, Cupula hemispherical
20992 Branches and under side of lvs covered with stellate down shining above lin.-obl. acute submucro. somewhat cordate undulately subsinuated rather coriaceous, Fruit solitary on a short peduncle, Cupula cyathiform
20993 Glab., Lvs wedge-shaped obov, on short petioles entire at base but slightly thd at top, Flwrs and fruit racem.
20994 Branches downy, L,vs obov.-obl, rounded at base sharply and sinuately toothed towards the apex coriaceous shining above but clothed with canesc. down ben., Fruit usually twin on short peduncs, Cupula cyathiform
20995 Lr's smooth oblong-lanceolate serrated rather coriaceous, Fruit sessile, Cup subhemispherical, Nut conical
20996 Lvs oblong-acute entire woolly beneath, Fruit nearly sessile and usually solitary
20997 Evergreen, Branches toment., Lvs coriac. obov. petiolate cuspidate obtuse sometimes serrated at top quite glab. above but clothed with glauc. toment. bereath, Acorns spic. obov. much longer than scaly tomentose cup
20998 Evergreen, Branches glabrous, Lvs petiolate coriaceous glabrous acuminate obtuse coarsely serrated beyond the middle glabrous above but clothed with glaucous down beneath, Acorns spicate spherical protruding a little beyond the cup, Cup tomentose tuberculate from scales
20999 Evergreen, Lvs roundish-ovate subcordate glabrous remotely spiny-toothed, Cupula hemispherical loose, Acorn ovate acute
[base female and top male, Spathe elliptic acute reflexed exceeding the spadix 21000 Stemless, Lvs pinnate 1-2 feet long, Leaflets alternate nearly sessile obl. ac. reflexed, Spadix obtuse with the 21001 Lvs ternately compound, Lfts pinnatifid entire or divided, Scape and petioles muricated at base, Spathe oblong acuminate exceeding the spadix, Ovaria ovate rettexed tubercled

21002 Leaves radical about 4 ovate-cordate, Spathe navicular horizontal terminated by a straight tail

21003 Leaves peltate cut into 5-6 ovate-lanceolate acuminate feather-nerved segments, Lower part of spathe green connate with the tube, upper part ovate convex pointed white with a transverse red mark
21004 Leaves pedate 6-7-parted, Scape purple, Spathe purple or pink \(5-6\) inches long obovate-oblong

21005 Leaves oblong-lanceolate, Spathe pedunculate long tubular fringed at top

21006 Stemiess, Lvs hastately cordate acute, Lobes obtuse, Spathe elongated incurved, Spadix male-flowered at top

21007 Caulescent, Leaves cordate-sagittate, Spadix contracted in the middle shorter than the spathe

21008 Lvs pedate, Leaflets lanceolate horizontal, Spathe subterete inflated lanceolate at top acute, Spadix acuminate, Petioles a foot high variegated with brown spots
21009 Stemless, Leaves sagittate acute rounded at base

21010 Caulescent radicant, Leaves decply tripartite, Lateral segments auricled on the outside at base, Petioles winged below, Spathe exceeding the spadix

21011 Stem twining suffrutescent, Lvs ovate-lanceolate acuminate, Sheaths petiolar long equal to scape, Spathe whitish brown

and Miscellaneous Particulars.
3270. Xanthosòma are West Indian caulescent plants with sagittate leaves and yellowish spathes. Their culture is the same as that for the caulescent tropical species of Pothos.
3271. Acóntias are South American plants with rhizomatose tuberous roots and pedate leaves, naked elongated peduncles, and green spathes. Their culture is the same as for the tropical species of Arum.
3272. Syngonium auritum is a tropical herb having the rhizoma changed into a scandent elongated stem and pedate-parted leaves. The peduncles are short and naked, and the spathes are of a dirty yellowish green. The culture is the same as for the tropical caulescent species of Pothos.
3273. Culcasia scandens is a tropical African herb with scandent stems, ovate-lanceolate acuminate leaves, and dirty brownish spathes. The petiolar sheaths are equal to the spathes. The culture is the same as for the tropical caulescent species of Pòthos.

History, Use, Propagation, Culture,
3274. Philodéndron is a gevus of tropical plants having the rhizomas changed into scandent or subarborescent stems. The leaves are large, remote, and often lobed. The culture is the same as for the tropical species of \(P \partial\) thos. 2275. Spathicuirpa hastifoliu is a South American herb, with a solitary radical hastately 3-lobed membranous reticulately veined leaf on a long stalk, and slender erect scapes. Culture the same as for the tropical species of \(A\) 'rum.
3276. Dicffenbachia seguina. This is a tropical plant with a thickish erect stem and oblong-ovate nerved leaves. The peduncles are short and recurved in the fruit-bearing state. The culture is the same as for Pothos.
32\%\%. Antherurus. Stemless herbs with tuberous roots, and triparted leaves on long petioles. The scapes are solitary, and sometimes bear bulbs as do the petioles. The spathes are narrow, green, and striated. Culture the same as for hardy species of \(A^{\prime}\) rum.

\section*{21012 Caulescent radicant, Leaves cordate sinuately pinnatifid}

21013 Caulescent radicant, Lvs cordate-oblong sagittate, Petiole semiterete marginate, Spadix acute, about equal to the spathe which is cucullately cylindrical contracted in the middle and ventricose at base
[apiculate length of spadix
21014 Caulescent radicant, Lqs petiolate lanceolate acuminate with a very thick inflated midrib, Spathe obtuse cucullate
21015 Caulescent radicant, Leaves hastate 3 -parted subcordate with an open recess, Lobes oblong acuminate wavy divergingly veined, Style fleshy, Stigma membranous rayed, Celis of fruit 1-ovulate
21016 Stemless, Lvs on longish petioles ovate-lanc. acute rounded at base finely ribbed coriaceous deep green shining paler beneath, Midrib thickened, Petioles thick shorter than leaves, Spadix on short peduncles, Spathe convolute at base exceeding the spadix a little
21017 Stemless, Lvs lanceolate veinless, Leaves 2 feet longer than scape, Spathe bluntish red outside and white inside and on the edges
21018 Caulescent radicant, Lys shining cordate-sagittate acute, Petioles terete, Spadix obtuse about equal to spathe which is cucullately cylindrical constricted in the middle and ventricose at base
21019 Caulescent radicant, Leaves on long petioles ovate-elliptic cordate at base rounded at top entire or deeply crenated 5 -nerved at base, Petioles longer than leaves thickened a little at base

21020 Stemless, Leaf radical solitary on a long petiole hastately 3-lobed membranous reticulately veined, Petioles sheathing at base, Scape slender erect exceeding the leaves, Spathe linear

21021 Stem thickish erect, Leaves oblong-ovate cuspidate, Peduncles short reflexed when bearing the fruit
\(\beta\) Leaves spotted and blotched with white and yellow

21022 Leaves ternate, Scape longer than the bulb-bearing petiole

21023 Caulescent, Leaves oblong with risen veins, Spathe yellowish green and \({ }^{\eta}\) lined lengthwise white and varnished inside

21024 Caulescent, Lvs subsagittately cordate acuminate, Lobes rounded and divaricate, Spadix cylindrical obtuse equal to the beak-shaped spathe, Anthers many-celled

21025 Leaves obliquely ovate-cordate pertuse, Spathe boat-shaped
21026 Lvs obovate-lanceolate acuminate at both ends ribbed, Spathe oblong acuminate flat subpetiolate sheathed about equal to the spadix

21027 Shrubby radicant, Lvs ovate on long petioles cordate acuminate shining glaucous beneath irregularly pinnate, Segments oblong-falcate acuminate 3-5-nerved, Spadix axillary solitary on long peduncles
21028 Caulescent radicant, Lvs elliptic-oblong cordate on long petioles pionate, Segments linear-falcate cuspidate 3-4-nerved, Spadixes axillary and lateral on short peduncles
21029 Caulescent radicant, Leaves on long petioles oblong acuminate entire, Spadix nearly terminal pedunculate, Flowers subtetrandrous
21030 Leaves ovate pinnate filamentosely fibrous at base, young ones entire, Spathe ovate-oblong acuminate erect, Spadix oblong cylindrical obtuse.
21031 Caulescent radicant, Outer branches leaffets whip-formed and pendulous, Leaves ovate-cordate entire or pinnatifid, Segments subensiform l-nerved
21032 Caulescent radicant, Leaves petiolate oblong-cordate cuspidate, Spadix terminal solitary on short peduncles, Flowers suboctandrous
21033 Caulescent radicant, Leaves on long petioles cordate perforated on one side and pinnatifid on the other, Spadix on short peduncles, Spathe gibbous exceeding the spadix, Flowers subtetrandrous

3278. Aglaonèma is a genus of erect tropical caulescent herbs, with oblong nerved leaves, having the petioles sheathing even to the very top. The peduncles are very short, and tise spathes are white and sweet-scented. Culiure of Pдthos.
3279. Homnlonema are subcaulescent herbs with cordate or sagittate leaves, short peduncles, and aromatic spathes. Culture the same as for the tropical caulescent species of Pothos.
3280. Monstera. Caulescent scandent radicant plants, with simple leaves, cultivated in the same manner as tro-
3281. Scindápsus. Caulescent scandent plants, similar to Mónstera, and requiring the same treatment.

> History, Use, Propagation, Culture,

3282．Sauromatum．Tropical herbs having globose fleshy tubers and short radical scapes，which are solitary and scaly at base．The leaves are pedate－parted and many－lobed．Culture of tropical species of \(A^{\prime} r \mathrm{rum}\) ．

3283．Dracunculus．Stemoss plants with globose tuberous roots and pedate－parted leaves．The petioles are dilated and stem－clasping at the base．The scapes rise from sheaths of the inmer leaves．The spathes are fetid． Culture of \(A^{\prime}\) rum．
3284．Pythonium．Stemless herbs with flattened，nearly globose，tuberous roots，with generally a solitary bipin－ natifidly compound leaf，longish erect scapes which are sheathed at base，and reticulated spathe jnclosing the spadix．Culture the same as for the tropical species of \(A^{\prime} r u m\) ．

3245．Amorphophállus is a genus of tropical herbs，with flat tuberous roots，decompound leaves，and radical scapes． Culture same as for tropical species of Arum．
3286．Remusàtia vivipara．Stemless succulent herbs with tuberous rhizomatose roots，having the branches elongated and bearing bulbs．The leaves are petiolate and peltate caudate acuminate，the peduncles are short and bracteate，and the spathes yellow．Culture of tropical species of A＇rum．

3287．Colocàsia．Herbs with tuberous roots，or shrubs with stems．The leaves are peltate．

21034 Stemless, Lvs simple ternate and pedate, Leaflets \(5-9\) oblong acuminate entire, Spathe ventricose at base connate with a flattish lamina exceeding the spadix
21035 Nearly stemless, Lys pedately many-parted, Lobes oblong acuminate, Spathe irregularly undulately repand at the mouth of the tube

21036 Lvs pedate-parted, Segments uniform lanceolate middle one the largest, Spathe furrowed inside warted, Spadix smooth at apex

21037 Lvs ternate on long petioles, Lfts pinnatifid, Segms ovate acute entire or divided, Scape and petioles muricated at bottom, Spathe oblong acum. much exceeding spadix, Ovaria ovate attenuated reflexed tubercled
21038 Tuber depressed, Leaf large solitary tripartedly cut several times petiolate, Secondary segms lanceolate acuminate, Outer segments pinnate, Scape variegated with purple involved in two membranous scales at base, Spathe thick boat-shaped convolute at bottom cucullate at top, Spadix clavate length of spathe
21039 Petioles rough from warts, Spathe ovate acute spreading equal to conoid spadix
21040 Petioles rough from warts, Spathe ovate bluntish spreading at top exceeding a little the cylindrical fusiform spadix
21041 Petioles smooth, Rachis of leaves bearing bulbs, Spathe ovate obtuse cucullate equalling the obtuse clavate spadix

21042 Rhizoma tuberous throwing out elongated bulb-bearing leafless branches, Lvs on long petioles peltate cordate acuminate, Peduncles short bracteate, Spathe yellow

21043 Stemless, Leaves peltate ovate repand semibifid at base, Scape shorter than petioles, Spathe much longer than spadix, Anthers many-celled

21044 Stemless sarmentose, Leaves on long petioles peltate cordate acuminate, Spadix terminating the scape, Spathe yellow

21045 Lvs cordate sagittate entire or tripartite, Lobes with a prominent angle outside at base, Spathe ovate-lanceolate reflexed at apex equal to the awl-shaped spadix, Rudimentary organs glomerate bristle-formed

21046 Lvs linear-lanceolate, Spathe erectly incurved, Spadix elongated filiform obtuse nutant

21047 Soboliferous, Pinnula obliquely triangular cuneate downward, drawn out on the outside, unequally and deeply jagged in front, Male flowers with 12-18 stamens, Berry globose depressed 1 -seeded
21048 Caudex and fronds very spiny
21049 Caudex humble slender annulate, Fronds pinnate, Leaflets sinuately fiddle-shaped with a solitary primary nerve erosely and doubly toothed white beneath

21050 Caudex a little tumid above, Lvs pinnate, Pinnæ coriaceous plicate entire bifid at top covered with silvery powder, Spathe solitary deciduous, Spadix compound pendulous hermaphrodite above and mixed with male flowers, Lower female flowers subdodecandrons, Berries globose

> and Miscellaneous Particulars.
3288. Gonatánthus sarmentosus is a stemless sarmentose herb, with peltate cordate acute leaves on long petioles, and a yellow spathe. Culture of Pothos.
3289. Typhòium. Stemless herbs with rhizomatose tuberous roots, and cordate or hastate nerved long-stalked leaves. The scapes are elongated, and rise from the sheathed bases of the leaves. Culture as for tropical species of
\(A^{\prime}\) rum. A'rum.
3290. Biarum is a genus of European bumble stemless herbs, with tuberous rhizomatose roots, and lanceolate or ovate undivided feather-nerved leaves on long petioles; petioles membranous, dilated, and sheathing at base. The scapes are usually solitary, rarely aggregate. The spathes are dirty green outside and purple inside, as well as the naked top of the spadix. Culture the same as for hardy kinds of A'rum.
3291. Orania porphyrocarpa is a slender palm tree with annulate unarmed caudex and pinnate fronds. The pinnæ are cuneate and a little lobed, and erosely toothed. The fruit is red, about the size of an olive.
3292. Iriartia andícola is a palm tree having a very tall unarmed annulate cylindrical caudex tumid in the middle, pinnate fronds, cream-coloured flowers, and yellowish brown fruit.

> History, Usc, Propagation, Culture,

3293．Dcsmóncus is a genus of Brazilian palms，with reed－like flexuous stems and sometimes scandent，all of thein supported by other plants．They are all furnished with large straight or hooked prickles．The frouds are scattered distantly on all parts of the stem or caudex，and they are remotely pinnate．The petioles are furnished with long sheaths，and are extended into strong tendrils with recurved hooks by which they hold by other plants．Flowers cream－coloured．Drupes red．

3294．Juba＇a．Tall palm trees，with thick stems，beset with the scale－like rudiments of the petioles．The spadix is branched．J．spectábilis is called Coquito in Chili，and is cultivated in gardens about Popayan for the sake of the nuts，which are edible．

3295．Attàlea is composed of tall or middle－sized palm trees，which are often prickly．The fronds are large and pinnate，and very neat．The spadixes rise from the bases of the fronds，and are simply branched，but in the fruit－ bearing state they are large，and droop from the weight of the fruit．The fowers are cream－coloured，the fruit is brown，and the nuta are edible．

\section*{MONADELPHIA.}
[much branched erect, Male flowers twin triandrous uniserial, Fruit oblong 21051 Unarmed, Stem tall stoloniferous, Pinnæ oblong-linear, Upper ones usually confluent truncate toothed, Spadix 21052 Caudex tall, Petioles densely clothed with brown hairs inside and rachis with brown scales, Pinnæ linear-lanc. acute at length bifid at apex, Spathe toment., Spadix flexuous at base, Male flwrs 12-androus, Fruit obl.
21053 Unarmed, Caudex tall, Margins of petioles and nerves reddish, Pinnæ narrow-lanceolate acuminate at length equally bifid, Spadix fastigiate, Mate flowers hexandrous, Fruit ovate-conical beaked
21054 Caudex tall, Petioles and rachis prickly, Pinnæ linear-lanceolate acuminate glaucous beneath with setose edges, Spadix and spathe prickly at base straight, Male flowers hexandrous, Fruit ovate-globose beaked
21055 Unarmed, Caudex middle-sized, Pinna linear-lanceolate, terminal one præmorse, Ribs and rachis beset with blood-red dots beneath, Spadix much branched, Fruit ovate

21056 Subscandent, Petiolar sheaths as well as hind part of rachis prickly, Prickles straight compressed, Tendrils houked, Pinnæ oblong-lanceolate acuminate, Inner spathe unarmed, Fruit pea-formed
21057 Petiolar sheaths beset with hooked prickles as is the rachis, Tendrils hooked, Pinnæ oblong tapering to both ends, Inner spathe prickly, Prickles nodose at base, Fruit globose
21058 Prickles on petiolar sheaths straight thickened at base, those of the rachis hooked, Tendrils hooked, Pinna oblong-lanceolate acuminate, Inner spathe very prickly, Fruit obovate
21059 A very pretty palm cultivated in Kew Gardens, but we know nothing else about it
21060 Caudex tall thick, Fronds pinnate, Spadix branched, Rudiments of petiole scaly
21061 Humble, Fronds erectly spreading, Fruit elliptic umbonate
21062 Caudex middle-sized thick often wanting, Fronds spreading, Base of petioles naked, Drupe obovate beaked
21063 Caudex tall, Fronds erect, Base of petioles fibry, Drupes elliptic
21064 Caudex very tall, Fronds erectly spreading, Drupes oblong rather 5 -angled acute
21065 Caudex very tall, Fronds erectly spreading, Drupes ovate-oblong conically beaked
21066 Caudex short \(3-4\) feet or wanting, Fronds erectly spreading, Drupes ovate umbonate, Fronds 18-20 feet

\section*{21067 Fronds large entire oblong serrated, Calyxes jagged}

21068 Petioles unarmed, Pinnæ linear-lanceolate acuminate entire or emarginate and subdenticulate biauriculate at base white and silvery beneath, Lower auricle largest, Branchesof spadix elongated fastigiate pendulous

21069 Leaves deeply bipartite, Segments lanceolate-linear acuminate
[D. austràlis
21070 Les narrow-lanceolate acuminate subfalcate thin willow-like 5-6 in. Iong, Cone smaller and more rigid than in 21071 Lvs oblong rounded at top 4 inches long, Cones oblong cylindrical 3 inches long, Tops of scales convex closely pressed 4 times broader than long, limber valuable
21072 Lvs large ovate-lanceolate acute 7 inches long, Cones spheroid 4 inches long, Tops of scales flat closely pressed 5 times broader than long

21073 L.vs in fives long, Cones pendulous solitary curved, Scales rounded at apex rhomboidal abruptly umbonate in middle obtuse smcoth, Seeds ovate 5 times shorter than blackish wing
21074 Lvs in fives long, Cones elongated horizontal verticillate straightish sessile, Scales rhomboidal at apex pyramidal obtuse. Seeds oblong 4 times shorter than their blackish wing
21075 Lvs in fours 6 inches long, secondary one narrowest primary ones membr. elong. scar., Scales transv., of apex depressed in middle umbonate and keeled, Seeds roundish wedge-shpd 4 times shorter than testaceous wing 21076 Branches stiff thick, Scales of bud linear ciliated, Lvs in fives \(1 \frac{1}{2}\) foot long triangular, Sheath long smooth Cones elongated obt., Scales with lozenge-shaped depressed pyramidal apexes terminated by all obt. mucrone 21077 Lus in fives very long, Cones straight horizontal ovate elongated solitary, Scales transverse at auex rhomboidal uncinate, Seed subrhomboidal wrinkled, 4 times shorter than testaceous wing

3296. Manicarrin is a middle-sized palm tree. The fronds are 15-20 feet long on unarmed petioles, which are beset with short brown hairs. The spadix is \(2-3\) feet long. The flowers have a very strong narcolic smell. The spathe is 3-4 feet long, fusiform or compressed, tapering to both ends, and terminated by a 2 -edged echinate macro.
3297. Arenga saccharifera. This palm has various uses: the fibres of the petioles are twisted into ropes, the mealy medulla of the trunk is used for the preparation of sago, and the saccharine juice of the spadix is made into sugar. The berries are full of stings.
32:18. Cyclánthus. A stemless plant nearly related to Car-ludóvica. The leaves are all radical, on long petiules, and bifid and plicate. The peduncles are radical, and shorter than the petioles. The spathes are entire or 2 -lobed and deciduous. The plants are of easy culture, and require shade and moisture.
3299. Dámmara. This genus is the same as \(A^{\prime \prime}\) athis No. 2011. The species are all broad-leaved coniferous trees, which furnish very valuable timber. They are all of easy culture, and can be increased by cuttings.

21086. Pinus Fremontiana, or Nut Pine. The kernels of the seed are pleasant in flavour and very nutritious, and they constitute the principal subsistence of the Indians who live in the mountains where the tree grows, for nine months out of the twelve. The shell of the seed is so thin that it can be broken between the thumb and finger.
21089. A'bies jezoénsis, or Jezo Spruce, is so called because it grows in the islands of Jezo and Krafto in Japan, whence it has been introduced to the gardens of the wealthy inhabitants of Jedo. Siehold describes it as a large tree, with a soft light wood, employed by the Japanese for arrows, and in the construction of domestic utensils. The plant is now introduced into England by Messrs. Standish and Noble. The leaves are of a hright green when young in two rows; about \(1 \frac{2}{4}\) inch long and a line and a half broad; soft when young, but stiff when old, and terminated graduilly by a distinct spine. The branches, when young, are covered with rusty down ; but, when old, become smooth. The cones are narrow, tapering, rather more than 6 inches long.
21092. Cèdrus Deoràra, or Indian Cedar, furnishes an excellent timber, and possesses all the qualities attributed by the ancients to Cedar of Lebanon. It is very compact and resinous, and has a fine, fragrant, refreshing smell, and

21078 Lvs in fives slender glaucescent, Cones oval verticillate horizontal, Scales rhomboidal at apex pyramidal erect with a transverse elevated line, Seed oval 4-5 times shorter than blackish wing
21079 Lvs in fives short slender glaucous, Cones pendulous verticillate ovate acute, Scales rhomboidal pyramidal straight sometimes prolonged and contracted in the middle, Seed oval 4 times shorter than the linear wing
21080 Lvs by fives 14 inches long triquetrous strong serrulated with rather long subscarious sheaths, Cones sessile solitary pendulons very long, Scales rhomb-tetragonal wrinkled, Wing 2 -lobed longer than the seed
21081 Lvs by fives slender very minutely serrulated very long with scaly subscarious sheaths, Cones usually solitary pendu. ov.-oblong, Scales rhomboid hardly pyram. wrinkled obt., Seed small with a sublanc. obt. wing
21082 Lvs by fives filiform triquetrous \(8-10\) inches long with rough angles and terete glabrous sheaths, Cones pedunculate pendulous 4-5 together ovate obtuse, Scales truncate ribbed recurved and obtuse at top
21083 Lvs in threes, Cones ovate with unequal sides, Scales cleft radiately truncate with a depressed umbilicus gibbous somewhat recurved
21084 Lvs in threes, Cones oblong with unequal sides, Scales quadrangular truncate at apex with a depressed umbilicus, those at base larger elevated and conical
[long with \(6-7\) rows of scales, Scales rnded those at base rather hooked each scale containing 2 wingless seeds 21085 Lvs in threes \(1 \frac{1}{2}\) inch long stiff twisted pale green, Brnchs vert. 5 or more in a whorl, Cones sol. sessile 3 inches 21086 Lvs in twos or threes or even solit. glauc. green \(1 \frac{1}{g}\) to 3 inches long stiff ending in a spiny point, Sheaths very short and rolled backwards, Brnchs in whorls, Cones \(2 \frac{1}{2}\) inches long with from \(6-7\) rows of scales, Scales thick larger ones near the middle bluntly pyramidal slightly angular and more or less recurved downwards, Seeds wingless oblong or egg-shaped \(\frac{1}{2}\) inch long dark brown with a thin shell
21087 Lvs in threes, Cones ovate with unequal scales, Scales wedge-shaped flattened mucronate, those at base elongated compressed recurved
21088 Lvs in threes resembling those of Pinaster 11 inches long, Sheaths slightly shaggy, Cones 3-4 together slightly pendulous 6 inches long, Scales largest in the widest part of the cone all elevated in the centre
21089 Lvs green distich mucronate, Cones narrow 6 inches long, Scales loose rounded convex
21090 Lvs linear acute entire distich, Cones roundish-oval, Scaies trapeziformly cordate, Bracts length of scales spatulate-oblong sharply toothed, Wing of seed plicate

21091 Lvs in tufts, Cones ovate abrupt, Scales adpressed, Crest of anther ovate flat erect
21092 Lvs in fascicles glaucous acute triquetrous, Cones twin oval-oblong erect

21093 Lvs lanceolate all spiny mucronate imbricate in 5 ranks or linear-lanceolate tumid falcate elongated distichly and horizontally spreading, Fruit terminating the short drooping branches
21094 Lvs linear-lanceolate mucronate glaucous beneath
21095 Lvs pectinate linear-lanceolate acuminate falcate
[tacle narrow covered with scattered bracts 21096 Lvs ovate-lanceolate acuminate, Male catkins in fascicles axillary on a common peduncle, Nut globose, Recep21097 Lvs coriaceous lanceolate acute, Peduncle solitary 1-flowered length of receptacle, Drupe globose oblique bluhtly mucronate
[the obov. 2-lobed receptacle, Fruit oblong obliquely and bluntly apiculated 21098 Lys stiff linear mucr. with a double glauc. line ben. very like those of the Yew, Peduncles solitary shorter than 21099 Lvs lanceolate acum. gląbrous with revolute margins, Male aments by threes 4 times shorter than the leaves
21100 Leaves lanceolate obtuse mucronate, Peduncles solitary 1-flowered, Drupe length of receptacle with an obtuse hardly oblique point.
[or alternate, Cones in clusters of 6-. 8 scales which are nearly 4 -sided with elevated centres many-seeded 21101 Leaves bright imbricate in 4 rows in old plants but expanded and awl-shaped in seedlings, Branches opposite 21102 Livs ovate-obtuse imbricate in 4 rows, Berries globose, Scales umbonate, Branches terete tom. divaric. spread. 21103 Leaves ovate-imbricate in 4 rows grass-green closely set in old plants, but expanded and awl-shaped in seedlings, Branches spiral alternate or opposite dense, Cones 3-4 together oblong \(1 \frac{1}{3}\) inch long of about 10 scales, the largest of which are in the middle, Seeds large dark brown
21104 Leaves ovate-lanceolate taper-pointed pungent scarcely a line in length. A tall tree called Mexican Cedar 21105 Branches 2-edged leafy, the younger short alternate 2-rowed spreading

and Miscellaneous Particulars.
is much used in the Himalayas in the construction of buildings, and for bridges and boats. It is much cultivated in Britain as an ornamental tree. It has also been successfully grafted on the Cedar of Lebanon.
21094. Podocarpus Tolarra is regarded with great esteem by the New Zealanders when growing. The wood is used to construct canoes, it being light, tough, and durable. It grows from 20 to 60 feet high, and the diameter of the trunk is from 6 to 18 feet. P. ferruginea is called Miro-Mairi by the natives of New Zealand. It grows from 20 to 60 feet high. Its wood is brittle, close-grained, and durable, of a red colour, and capable of receiving a high polish. The fruit is eaten by wood-pigeons. Podocarpus Yacca furnishes most beautiful grained wood.
21105. Cupréssus funèbris is, perhaps, the most interesting consferous tree yet introduced into this country ; and will, probably, displace the weeping willow. A figure of it is given in Lord Macartney's "Embassy to China; "where it forms a weeping tree in the foreground of a view of the "Vale of Tombs,"- a place situated in the inclement climate of Zhe-hol. It is used to adorn cemeteries.

History, Use, Propagation, Culture,
3301. Cállitris. A pretty coniferous tree, and may be increased by cuttings or seed
3302. Phyllocladus rhomboidali, is a native of Van Diemen's Land, where it is called by the colonists Parsleyleaved, or Adventure Bay, Pine. P. trichomanoides is a native of New Zealand, and is called Tanckaha by the natives, who use the wood for building purposes, and the bark for dyeing a red colour.
3303. Widdringtonia cupressoides. This is a very pretty tree, and is the cypress of South Africa. The leaves are
3304. Saxegothe'a conspicua is an evergreen tree, about 30 teet high, with the habit of Táxus
linear and flat, and marked with a pale double line beneath.
3305. Frenèla is a genus composed of resinous trees or shrubs. The leaves are ternately verticillate, scaleformed, adnately decurrent, persistent, and glandless. Being natives of New Holland they require protection, and may be increased by cuttings.
3306. Fitzóya patagónica is a graceful drooping evergreen tree with the habit of Libocèdrus tetragdna. When young, the leaves are spreading and linear; when old, they become triangular, sessile, and closely imbricated scales. The female fowers are terminal and stellate cones, remarkable in having the axis terminating in three short clavate glands or abortive scales. The fruit is of 9 scales, 3 in each whorl; the middle 3 are alone fertile, and each fertile scale has 3 erect seeds surrounded by a broad wing and ending in a narrow neck.

2106 Branchlets compressed spreading, Leaves rhomb-ovate adpressed imbricate in 4 rows tubercled in middle, Cones oblong nodding, Seeds obcordate
21107 Leaves flattened articulated, Female catkin tetragonal with 4 oval valves each furnished with a point and 2 of which bear seed only

21108 Fronds rhomboid lined deeply serrated, Lower ones cuneate decurrent
21109 Fronds pinnate, Leaflets cuneate deeply lobed, Lobes truncate toothed

21110 Branches elongated fastigiate, Leaves on branches acute distant spreading, those on the branchlets bluntish more approximate and adpressed arranged in 4 rows, Fruit nearly globose, Scales of strobile thick terminated by a conical mucrone, Seeds 10 in a double series
2111 Branches erectly spreading rather drooping, Leaves in young plants strong and elongated linear spreading flat sessile glaucescent, in more adult trees short and triangular acutish adpressed on the pendulous branches subimbricate and cypress-like, Fruit subglobose

21112 Habit of Yew, Leaves linear flat apiculated marked by a pale double line beneath

\section*{21113 Resembles an Evergreen Cypress}

21114 Habit of Cypress, Branches thin articulated, Lvs imbricate adpressed, Female catkins small solitary terminal 21115 Leaves linear crossing appressed, Branches very slender
21116 Habits of rhomboidea, but the catkins are much longer

21117 Tree evergreen drooping, Leaves sessile imbricate, Female flowers of 9 scales in 3 series stellate
21118 Tall, Leaves like those of Araucària Cunninghàmi but larger subulate disposed in 5 rows vertically compressed hardly I inch long, Male aments aggregate into a terminal spike, Seed solitary globose
\(\beta\) A small stunted variety
21119 Leaves opposite scale-formed, so placed on the branches as to constitute a 4 -sided arrangement, Cones consist of 2 opposite pairs of scales each having a long horn or beak
2120 Habit of Arbor Vitæ, Leaves opposite ovate-oblong scale-formed decussate imbricate in 4 rows, Cones ovaloblong of 4 scales, Seed winged at top

21121 Leaves pectinate on the young branches linear mucronate, adult leaves small compressedly triquetrous distich closely imbricate keeled obtuse concave above, Branches opposite flattened

21122 Branches pendulous filiform terete tetragonal at top, Lvs spreading acute. Scales of strobile roundish bluntly mucronate at apex recurved 1 -seeded, inner one abortive, Seed wingless
21123 Branches flattened imbricate, Leaves in 4 ranks smaller than in other species

and Miscellaneous Particulars.
3307. Cryptomeria japónica, or Japan Cedar, is a fine evergreen perfectly hardy tree. Thunberg, who was the first to make this tree known in Europe, states that it is found, both cultivated and spontaneous, on the mountains of Nagasaki and elsewhere. The Japanese call it \(S a n\), or \(S u g i\); which, in their language, means evergreen tree. It is a tall upright tree, with a pyramidal head. The timber is said to be soft, and easily worked; and is used for various purposes, particularly for cabinetwork, among the Japanese. According to Siebold, it is a majestic tree, growing from 60 to 100 feet high. Nothing was known of the living plant. until Mr. Fortune succeeded in obtaining seed at Shanghae, in the North of China, where it had probably been introduced from Japan ; and from these seeds the first plants were raised in Britain.
3308. Libocedrus tetragòna promises to outvie the Araucaria imbricàta, and to be as hardy; for it comes just below the snow-line in the Andes of Patagonia. The leaves are rather broad, and are imbricate in four ranks. It is a magnificent evergreen tree. L. chilénsis is a fine evergreen tree, resembling the Chinese Arbor Vitæ; but is of a less robust habit, and will, probably, prove hardy. L. Doniana is a tree from 30 to 40 feet high, and is called Kawa by the New Zealanders. Its trunk is from 1 to 3 feet in diameter. The wood is beautifully gra ned and heavy, and would make handsome picture-frames if they were required of a deep colour.
.3309. Biola. The species are very showy coniferous trees, of easy culture.
 - pictum Juss \({ }^{\text {Croton pictum Lid. No. } 13641 \text {. }}\). 2033. JA'TROPHA.

History, Use, Propagation, Culture,
3310. Codiee um. This genus is separated from Crdton. They are Asiatic trees, with alternate, entire, glabrous, shining leaves, which are sometimes beautifully variegated. The flowers are disposed in unisexual, axillary, and terminal racemes, each of which is furnished with a bract. They are of easy culture, and only require the treatment of ordinary stove shrubs.
21128. Sterculia pubéscens. There is a gum collected from this tree resembling gum Tragacanth in its properties;

\section*{Page 816. Class XXII. - DIGECIA.}

\section*{Order 2. DIANDIIIA. Stamens 2.}
3311. 2044a. Gynèreum. Spikelets 2-flowered; one flower sessile, the other stalked.-Male. Glumes lanceolate, membranous: Keel unequal. Paleæ 2, membranous, 1-nerved, concave, beardless; upper one shortest, bicarinate. Stamens 2. Scales 2, minute, collateral.-Female. Glumes 2, upper one longest. Paleæ 2, upper one beset with long hairs : inner one small, bicarinate: Keels pectinately ciliated. Stamens 2, effete. Ovaria 2, glabrous. Styles 2, ter. minal. Stigmas plumose. Scales 2, membranous, subciliated.

\section*{Order 5. PENTANDRIA. Stamens 5.}
3312. 2066a. Corokia. Male plant unknown. - Female flowers having the calyx tube adhering to the ovarium. Linb 5-cleft, valvate in æstivation, persistent. Segments lanceolate, deciduous. Petals 5, epigynous. Disk fleshy, glandular. Ovarium 2-celled, inferior. Style simple. Stigma capitate, lobed. Drupe dry, spherical, brittle, shining, umbilicate, villous. Seeds solitary in the cells.

\section*{Order 6. HEXANDRIA. Stamens 6.}
3313. 2084a. Coscinium. Sepals and petals in threes. - Male flowers with 6 stamens. - Female flowers with 3 ovaria. Styles slender. Berries \(1-3\) together. Seed pierced by a large hole.
3314. 2085a. Hélmia. Diœcious, rarely monœcious.-Male. Perianth rotate or urcenlately campanulate. Stamens usually 6, sometimes only 3.-Female. Perianth G-cleft, with equal spreading or reflexed segments. Styles combined into a column, or wanting. Stigmas 3, entire, or 2-lobed. Ovarium triangular, 3-celled. Capsule triquetrous, 3-celled. Cells 2 -seeded. Seeds winged at base.
3315. 2086a. Litscª . Flowers covered by bud-scales. Perianth 4-5-6-parted.-Male. Stamens 6, of which 4 or 2 are biglandular. Anthers introrse, 4-celled. dehiscing by as many ascending valves.-Female. Sterile stamens 4, submucronate. Style short. Stigma discoid, lacerated. Berry l-celled, 1-seeded, naked, standing on thickened pedicels.

\section*{Order 8. ENNEANDRIA. Stamens 9.}
3316. 2089a. Anácharis. Calyx 3-parted. Petals 3.-Male with ovate-oblong sepals, and linear petals. Stamens 9. Filaments combined into a column at base.-Female flowers with a long filiform tube, 3 abortive filaments, and ligulate stigmas. Capsule 1-celled, few-seeded.
3317. 2090a. Tetranthèra. Dicacious, rarely hermaphrodite. Perianth 6-parted, nearly equal, deciduous, sometimes fewer or wanting altogether. Stamens !, in 6 -cleft fowers, in three series, fertile: in petaloid or naked flowers 1221, the inner ones furnished each with 2 sessile or stipitate glands at base. Anthers introrse, 4-celled, dehiscing by as many ascending valves. Ovarium immersed in the tube of the perianth. Style short. Stigma peltate. Berry Iseeded.

21124 Leaves oblong-lanceolate obtuse at base variegated and stained with red and yellow, Spikes axillary erect

21125 Stem erect-branched gouty at base, Leaves peltate-cordate 5-lobed glabrous, Lobes subovate blunt, Stipules glandularly fringed, Cymes on long peduncles terminal, Teeth of calyx and loves of corolla blunt
21126 Leaves palmately 5 -lobed with wide recesses, Lobes spatulately obovate acuminate hairy on the nerves beneath and petioles
21127 Leaves coriaceous obtuse lanceolate entire or 3-lobed glabrous, Lobes acuminate
21128 Leaves oval-oblong cordate at base downy as are the petioles and young branches, Flowers axillary panicled, Segments of calyx cohering at apex, Carpels \(4-5\) downy \(4-5\)-seeded, Seeds small red
21129 Leaves oblong acuminate entire smooth on long petioles, Flowers panicled axildary, Carpels 4 - 6 -seeded, Seeds white large
24130 Leaves obloug acuminate entire smooth on long petioles, Flowers axillary panicled, Carpels 1 - 2 -seeded, Seeds red large

and Miscellaneous Particulars.
but it is probable that many of the species have the same kind of substance, as it seems nothing more than the concrete state of the mucilage.
21129. Stercillia macrocápa and S. acuminàta. The seeds are known in Africa by the names of White and Red Cola or Kola. They have long been celebrated by voyagers as possessing a high degree of value among the natives of Guinea, who take a portion of one of them before each meal, for they euhance the favour of anything they may subsequently eat or drink. The seeds are extremely bitter.

\section*{Order 9. DECANDRIA. Stamens 10.}
3318. 2092a. Nuttália. Calyx free, campanulate, 5 -cleft; of the female separating transversely above the base. Petals 5 , oblongooval, rather unguiculate. Stamens 10, in 2 series. A nthers roundish. - Female. Stamens as in the male, but sterile. Ovaria 5, free, 1-celled, wbliquely obovate, glabrous, biovulate. Style filiform, articulated at base, deciduous. Stigma dilated. Carpels subdrupaceous, \(2-3\), sometimes solitary by abortion, I-seeded, a little incurved.

\section*{Order 12. POLYANDRIA. Stamens numerous, inserted under the ovarium.}
3319. 2106a. Boldòa. Male. Perianth campanulate, 5-cleft, having 5 petaloid scales in the throat, alternating with its segments. Stamens numerous, inserted in the throat of the calyx. Filaments flattened, auricled on both sides above the base. Anthers 2 -celled. - Female. Perianth as in the male, but with the scales in the throat narrower, and abortive and gland-formed stamens. Ovaria 2-9, conical, conniving, on short stipes, cohering at top. Styles tiliform, distinct. Stigmas simple. Drupes \(2-9,1\)-seeded, naked in consequence of the perianth beiug decinuous.
3320. 2106b. Tasmánnia. Diœcious or polygamous.-Male. Stamens indefinite, a littlecurved. Pistil rudimentary. -Female. Scpals 2. Petals \(2-5\), deciduous. Stigma adhering longitudinally to the inner side of the ovaria. Fruit membran-us, indehiscent, l-celled, many-seeded
3321. 2108a. Encephalártos. Mate. Anthers open, collected into a terminal pedunculate strobile, inserted all over the common rachis.-Female. Carpels numerous, collected into a terminal pedunculate strobile all over the common rachis. Fruit syncarpous. Single scales oblong-cuneate, thickened at apex, obtuse or acuininate. 3322. 2108b. Dion. Strobile ovate, dense, woolly, size of an infant's head, composed of densely woolity stalked scales, which are cordate acuminate, smooth inside, with a solitary seed on each side at base. Seed size of a Spanish chestnut.
3323. 210sc. Freycinètia. Diocious or pseudo-polygamous.-Male. Spadix simple, covered with flowers. Filaments filitorm. Anthers 2 -celled, dehiscing lengthwise.-Female. Spadix simple, covered with pistils. Ovaria combined in bundes, 1-celled. Fruit baccate, many-seeded and many-celled from the carpels being combined. Seeds numerous, minute, fusiform.

\section*{Order 13. MONADELPHIA. Stamens united into one body.}
3524. 2109a. Plectocomia. Flowers on an elongated spadix, disposed in simple or branched spikes, hidden by incomplete scale-formed distichly sessile imbricate spathes. Male flowers twin: female solitary. Calyx trifid. Corulla 3-parted, valvate. Stamens 6, subulate, monadelphous at base.-Female calyx as in male. Filaments without anthers, combined into a 6-cl.ft memhranous cupula. Ovarium 3-celled. Stigmas 3, nearly sessile, subulate. Berry l-celled, seeded. loricate from retrograde scales.
3325. 2109b. Lodoicea. Male catkins cylindrical, closely imbricate from the coalition of the scales. Flowers bracteate, arranged in 2 rows in the pits of the rachis, aggregate. Calyx deeply 3 -parted, or of 3 sepals. Stamens 24 -36, monadelphous at base. Anthers linear, truncate, rather 2-lobed at hoth ends.- Female flowers solitary within the perfoliate scales of the catkin. Calyx of 3 sepals. Petals 3. Ovarium 2-4-celled. Stigmas 2_4, sessile, con-
niving．Drupe fibry，2－lobed，2－4－seeded，but usually only 1－seeded．Sarcocarp thick，flbry．Nuts or seeds bony， adhering to the fibres of the sarcocarp．
3326．2114a．Torreya．Male catkins at first globose，but at length elongated，the rachis ultimately becoming naked， except at the base，where it is bracteate by quadrifariously imbricate scales．Staminiferous scales pedicellate，rather peltate，each bearing a 4－celled anther．－Female catkin ovate， 1 －flowered，bracteate at base as in the male．Seed ovate， bony，bracteate at base by the increased scales．
3327． \(2114 b\) ．Cephalotâxis．Male catkins axillary，capitate，propped by bracts．Stamens 4－6，or more，in each scale．－Female catkins from the axils of the shoots of the present year．Fruit 2－3 in each head，drupaceous，adnate to a closed fleshy urceolus．
3328．2ll4c．Dacrýdium．Male catkin ovoid，girded by imbricating bracts at base．Stamens numerous，imbricate，

> History, Use, Propagation, Cultuse,

21151．Mauritia vinifera．The berries are ovate，the size of a hen＇s egg，and of a chestnut colour，and are called Buriti or Bruti，by the natives of Brazil．These berries are used for many purposes．The caudex yields a large quantity of palm wine when wounded，which is of a sweetish acid taste，not unlike ginger beer．
21156．Hélmia racemòsa is nearly related to Dioscòrea，or Yam．The flowers are small，yellow and purple．The root is tuberous and fleshy．The plant requires the same treatment as Dioscarca．
21155．Coscinium fenestratum is in repute amorig the inhabitants of Colomba，in Ceylon，who slice the wood，which is yellow and bitter，in thin pieces，and swallow them with the liquid，after steeping them in water several hours．They commend it as an excellent stomachic．It is the Colomba wond of commerce．

21148 Caudex ringed, Sheath short auricled at top, Pinnæ neat lanceolate, Spadix loose angular, of the female doubly branched, Female corollas tridentate, Drupes subglobose
21149 Stolonif., Caudex covered with sheaths of fronds, Petis short nearly terete, Lvs pin., Pinnæ flat lanc. subfalc. taper-pntd at both ends, Spadix under the fronds simply brnchd, Berries glob. size of a pea blackish green

21150 Caudex flexuous spinose, Fronds pinnately fan-shaped, Pinnæ linear glaucescent beneath, Fetioles terete, Spadix glabrous, Fruit ovate, Scales of fruit broader than long, Spadix 2 feet
21151 Caudex tall erect unarmed, Fronas pinnately fan-shaped same colour on both sides, Petioles semi-terete channeled, Scales of fruit ovate-rhomboid, Spadix 6-10 feet
21152 Stem prickly, Leaves ovate-cordate smooth 3-nerved, Berries acuminate
21153 Leaves sagittate

21154 Very like the Cape species, and perhaps only the same plant cultivated in Mexico
21155 Leaves cordate entire \(5-7\)-nerved shining above hoary beneath, Peduncles umbellulate, Berries villous

21156 Twining glabrous fleshy, Root tuberous, Leaves scattered cordate-ovate acuminate 9 -nerved glandular at base, Male raceme axillary solitary
21157 Leaves alternate nerved, Flowers in axillary fascicles imbricated by dense scales

\section*{OCTANDRIA.}
[long loose weak petioles, Stipules acute spreading 21158 Leaves loose drooping coriaceous ovate rather concave wavy generally cordate acuminate coarsely crenated on
[spreading
21159 Leaves fiat erect oblong-lanceolate obtuse glandularly crenated paler beneath on short petioles, Stipules acute 21160 Leaves spreading flat ovate or roundish-ovate shortly acuminate closely and slightly glandularly crenated paler beneath on long petioles, Stipules apparently adpressed
21161 Leaves flat oblong or lanceolate oblong rounded or cordate at base acuminate glandularly crenated paler beneath on longish petioles, Stipules erect mucronate
21162 Leaves spreading variable in form oblong-roundish rhomboid-oval or ovate-elliptic cordate at base closely and minutely glandularly crenated whitish beneath on short petioles, Stipules obtuse adpressed

\section*{ENNEANDRIA.}

21163 Leaves 3 in a whorl obtuse serrulated, Male flowers unknown, Female flower with a long tubular bifid spathe many times longer than the sessile ovarium, Sepals and petals broad nearly equal, Stigmas reflexed
21164 Leaves cuneate obovate obtuse smooth
21165 Segments of perianth petaloid ovate lanceolate, Leaves oblong marginate glabrous above and hoary tomentose beneath, Umbels axillary aggregate on short peduncles, Involucrum 5-leaved 5-6-6wd, Calyx 5-cleft

\section*{DECANDRIA.}

21166 Leaves ovate-lanceolate acute opposite about 5 -nerved nearly sessile, Racemes fascicled axillary, Flowers hermaphrodite
21167 Arboreous, Lvs rising with flowers from same buds alternate cuneate-ohlong apiculate entire downy or glab. narrowed into the short petioles, Racs pend., Bracts memb. acum., Flws white with odour of bitter almonds

and Miscellanevius Particulars.
3315. Litsaca. A plant of easy culture, only requiring the treatment of other stove shrubs.
21163. Anácharis alsinástrum is a plant in habit much like some species of Potamogèton, and has been recently discovered as a native of Britain, but may have been introduced from North America, as the female plant has only discovered as a native of fast when introduced into canals, ponds, or rivers, that it soon chokes them up, and for this reason is a great pest wherever it grows.
3317. Tetranthèra. Cultivated and treated like any ordinary hothouse plant.
21167. Nuttállia cerasiformis is a hardy shrub, with much the habit of a species of Spira' \(\alpha\), or Cérasus, or Birdcberry.

and Miscellaneous Particulars.
nuts vessels of different forms and uses are made. The leaves are employed to thatch houses. The young foliage affords an excellent material for hats. The trunk is split and used for palisades for surrounding houses and gardens.

Lodoicea seychellårum is the Sea or Double Cocoa-nut of the Seychelles or Praslin, and is a beautiful palm tree, growing to the height of 60 to 80 , or even to 100 feet; the trunk is annulated from the scars of the fallen leaves, about a foot in diameter, and is equal in thickness from top to bottom. The trunk yields to the slightest breeze, and when the wind is moderately strong the huge leaves are crashed together with an astonishing noise. The part of the trunk immediately above the surface of the ground forms an inverted cone, which is terminated below by a hemispherical base, whence spread in all directions a great number of curd-like roots, penetrating to a considerable distance around. These roots remain long after the destruction of the plant itself. So firmly are the leaves attached to the trunk that a man may seat himself at the end of one of them with perfect safety. I he texture of the leaflets is very strong, and consists of fine threads or fibres, disposed in three layers; the direction of the two outer layers is longitudinal, and that of the central layer cransverse. Mr. Clark estimatestbat three of the leaves, only one of which is produced each year, occupy 8 inches on the stem, and that consequently a tree of 80 feet in height must be about 400 years old. According to the same authority, the male and female spadix, instead of rising from the angle of the accompanying leaf-stalk, passes through a fissure at its base: he also states that, although the tree puts forth only one spadix in a year, ten or more may be seen flowering at the same time; this is to be explained by the multiplicity of flowers in each catkin, which blossoin successively. The female trees bear llowers and fruit in all their different states at the same time. As many as seven well-formed drupes are sometimes produced on a single spadix, and 7 or 8 years are required for the full maturing of the nut. This fact Mr. Clark states to have been ascertained on one of the female Lodoiceas planted at Mahé, which had flowered for several years without producing fruit, owing to the absence of the male plant. A male flower was procured from an estate a few miles distant, and suspended in the tree, and about two months afterwards one of the buds expanded, and finally arrived at maturity. The experiment was made in 1833, and the fruit fell at the latter end of 1841 . The drupe attains the length of 15 inches, is about 3 feet in circumference, and weighs from 30 to 40 pounds. When the fruit has reached its full size but is still soft (in which state it is called

> History, Use, Propagation, Culture,
coco-tend̈e), it may easily be cut through with a knife. A transverse section, Mr. Clark states, successively displays the husk, green on the outs de, but whitish within, of a harsh astringent taste, much like the husk of a common cocoa-11ut, inside of which is a substance which is destined to form the shell; next follows a layer, more or less thick, of a mealy insipid substance, of a white colour, covering a yellow substance of a very decided bitter, and said to be poisonous, which encloses the perisperm. This is a white translucent mass of a gelatinous consistence, and sweetish taste; taken at the proper period it furnishes an agreeable food, much esteemed by the Sechellois. In the centre of this, where the two lobes of the perisperm unite, is the germ, at this period scarcely visible. The germination of the geed sometimes commences before the fall of the fruit, but most frequently after. It is prevented by burying the nut, but readily takes place on the surface of the earth, in a situation not too much exposed to the sun. The length of time from the germination to the period when the trunk begins to form above the ground, is stated at from 15 to 20 years, and even in favourable situations the Lodoícea is full 25 years before producing flowers.
21182. Araucaria Coókii is more dense in habit than A. excélsa, the Norfolk Island pine. The scales of the cones do not terminate in a hard woody truncate extremity, as in that species, but in a long reflexed appendage. In the Island of Aniteura, where it was first discovered, the tree has become scarce, the English having cut down the trees for ship spars. Mr. Moore, the colonial botanist in New South Wales, saw only one plant there, and this was tabooed or rendered sacred by the natives; but in New Caledonia, on the south-east coast, whole forests of this tree alone were observed. In such situations the tops are not unlike basaltic columns. Mr. Moore mentions the firstplant of it noticed by Captain Cook, who describes it in his account of New Caledonia as an elevation like a tower. It still stands, and is in a flourishing condition. Its appearance now is like a well proportioned factory chimney of great height. A. Bidwilli \(i\) is a fine species, and grows also to a large tree. It is called Banza-Tunza or Banya-Tunya.
21192. Torreya taxifolia. This tree has a strong and peculiar odour when burnt or bruised, and hence it is called Stinking Cedar in its native country. The wood is not liable to the attacks of insects. T. Humboldtiz is a tree of much paler green colour than T. iaxifolia.

21182 Adult leaves closely imbricate incurved convex obtuse keeled on the back, Female aments ovate-elliptic, Scale 2 -seeded terminated by a long reffexed mucrone
21183 Branchlets opposite, Leaves flat ovate-lanceolate pungent, young ones subsecund, adult ones spreading on all sides, Scales of strovile with a hooked reflexed point
21184 Leaves tern spreading acute 3 times shorter than fruit, Nut 3-celled
21185 Arboreous, Leaves all scale-formed in 4 ranks obtuse marked by a circular hollow on the back, Branches slender tetragonal, Fruit spherical glaucous on short stalks
21186 Leaves tern spreading mucronate keeled 1 -nerved, Berry elliptic longer than leaf. A handsome shrub covered with violet bloom
[bilicate, Branches and branchlets crowded terete, Stem prostrate 21187 Leaves tern adpressedly imbricate ov.-oblong ac. or acuminate persistent young ones inflexed, Berries ovate um21188 Lvs lin,-lanc. muc. loosely imbri. smooth convex ben., Berries rndsh-oval tuberc., Brnchs and binchlts recurv. 21189 Branches flattened, Leaves in 4 rows closely imbricate rather thick obtuse ovate, Berries globular small 21190 Branches pendent, Leaves ovate lanceolate in 4 rows, Berries globular with projecting pointed scales 21191 Leaves in 3 rows often only opposite ovate acuminate, on the young shoots they are only half-line long

21192 Leaves distich stiff mucronate exstipulate, Branches distich and forked
21193 This species is in the Gardens, but is not yet described, but it appears very distinct
Con short bracteate peduncs, Amentules or scales shorter than the broad-ov. conc. erose bracts 2194 Lvs of brnchs distich sessile pectinately disposed lin. acum. 3-4 inches long stiff paler ben., Male aments glob. 21195 Leaves distich flat \(1 \frac{1}{3}\) inch long green above and glaucous beneath except on the midrib and revolute edges where they are green mucronate on short foot-stalks

21196 Leaves linear-subulate tetragonal mutic green with elevated angles, when young divaricate but loosely imbricate in the adult state, Branches flexuous dependent
21197 Arboreous, Leaves crowded without order erectly spreading mucronate. A large timber tree of slow growth
21198 Branches tetragonal, Leaves small opposite adpressed ovate-acuminate keeled, Female aments terminal curved drooping 5-7.flowered, Fruit loosely spicate, Male scales small, Fructiferous scales concave cleft in front, Seed small erect elliptic subdrupaceous
21199 Leaves loosely imbricate subulate compressedly tetragonal mucronate glaucous with depressed angles
[branches stiff, younger ones twiggy
21200 Lvs turned linear obtuse with a callous point and revolute margins green above and glaucous beneath, Adult

21201 Leaves twice or thrice ternate often simple, Leafets oblong acute unequal at base and with one or two tecth on one side, Bracts 2 large unequally cordate at base of peduncles
21202 Twining, Leaves ovate-lanceolate entire, Flowers in fascicles, Peduncles bracteate hardly equalling the petioles in length, Anthers sessile immersed, Berries 2 -seeded, Spike a tuberculated receptacle
[naked
21203 Leaves broad cordate a little lobed at base villous beneath, Racemes crowded at the base of the branches

and Miscellaneous Particulars.
21194. Cephalotáxus Fortùnï is said by Mr. Fortune to grow to the height of 40 to 60 feet. The leaves are distich, alternate, opposite, close together, 3 or 4 inches long, acuminate, 1 -nerved. It increases by cuttings, like the Yew.
21196. Dacrýdium cupréssinum is a red pine which attains the greatest perfection in moist rich soil. The tree grows to the height of 80 feet, and the trunk is 4 feet in diameter. The foliage is said to be graceful. Captain Cook prepared a kind of spruce-beer ont of the bitter resinous juice, which he found excellent in scorbutic complaints. The wood is close-grained, and much resembles the Bermuda Cedar. It is the New Spruce Tree of New Zealand, mentioned in Cook's "Second Voyage," vol. i. p. 70. t. 51. D. excélsum grows to a very large tree, and is called Kahi-Katea by the New Zealanders. D. Franklinii is the Huon Pine of Van Diemen's Land. It is a noble timber tree, growing in swampy places, is of a pyramidal form with rather drooping branches, the ultimate ones are pendulous The wood burns briskly, giving out a pleasant aromatic odour. It is close-grained and valuable for ship-timber, and for all purposes to which pine wood is applied; and is readily obtained in logs 40 or 50 feet long. The Huon Pine forms the principal article of exportation from Macquarie Harbour. 2869 logs were collected, in one year, from different spots near the neighbourhood.
3329. Lardizabala biternìta is a hardy evergreen creeper, well adapted for covering high walls, the foliage being dark green. The flowers are of a deep purplish chocolate colour. The fruit is sweet and edible, and is sold in the Chilian markets under the name of Aquilboquil, of Guilbogui in Peru, and of Coguill-Vochi in Chili.
3330. Spharostémma propinquum is a climbing shrub requiring protection in winter, but it is otherwise of easy culture.
3331. Phytocrène gigantè is a large twining shrub, with soft porous wood, from which issues a quantity of limpid watery juice in great quantities on being cut. The leaves are large, cordate, and petiolate. This plant should be cultivated and treated like other stove climbing shrubs.

3332．Neptinia is a genus of floating water－plants，with leaves sensitive to the touch，like those of the seusitive plant． They grow well in a stove aquarium，or in tubs or pans filled with water，having a few inches of mould in the bot－ tom．They require to be placed in a warm situation in a hothouse．

21204 Leaves petiolate oblong, Pitchers naked somewhat ventricose at base thickish marcescent above depressed and striated at the mouth, Racemes very long, Pedicels I-flowered
21205 In the Gardens, but not yet described, not having flowered
21206 Stem creeping at base with ulniferous surculi but at length foliiferous and erect, Tendrils of leaves mutic, Pitchers petiolate winged in front coarctate at the mouth roundish and striated having the lid lanceolate reflexed and tricuspidate behind, Plant covered with rusty down
21207 Leaves petiolate, lower ones beariug ventricosely campanulate pitchers which bear broad membranous wings in front, Wings ciliated, those of the upper leaves funnel-shaped and naked, all beautifully striped
21208 In the Gardens, but not yet described
21209 In the Gardens, but not yet described
21210 In the Gardens, but not yet described
21211 Dwarf, Pitchers deep reddish brown outside and marked with the same colour inside

\section*{Order 2. DIGECIA. Flowers diœcious.}
3335. 2153a. Phytélephas. Flowers polygamous, diœcious. Spathe l-leaved. Spadix simple, clavate, densely beset with flowers. Calyx urceolate, obsoletely many-toothed. Stamens uumerous. Styles 5-6-cleft. Drupes aggregate, muricate, 4 -celled. Cells 1 -seeded. Albumen horny.
3336. 2154a. Skímmia. Flowers polygamous. Calyx 4-cleft, persistent. Petals 4, unguiculate, decidıous Male. Stamens 4, hypogynous, alternating with the petals. Disk fleshy, 4-lobed, girding the short apiculated rudiment of an ovarium.-Female flowers with rudiments of stamens on an annular disk, which girds the ovarjum. Ovarium free, 4-celled. Ovula solitary in the cells, pendulous. Style cylindrical, simple. Stigma thick, 4-lobed. Drupe fleshy.
3337. 2157 a Antiàris. Flowers monœcious.-Male. Involucrum many-leaved, many-flowered. Leaves in many series, imbricate, counate at base, girding the orbicular flat convex receptacle, which is concave below. Flowers sessile, crowded. Perigone 3-4-leaved. Leaves spatulate, conniving at top. Stamens 3-4, opposite the leaves. Filaments short or wanting. Anthers extrorse, 2-celled.-Female flowers. Involucrum 1-fowered, urceolate, muitifid at top. Perigone wanting. Ovarium lecelled, combined with the involucrum, containing only one pendulous ovulum. Style terminal, bifid, the legs filiform and stigmatose inside. Drupe formed of the baccate involucrum.

\section*{MONECCIA.}

21212 Branches slender spreading villous when young, Leaves with \(4-5\) pairs of pinnæ, each pinna bearing from 20 26 pairs of small lin. obt. closely imbricate adpressedly ciliated leaflets, Heads solitary pedunculate peadulous
21213 Glabrous. Prickles scattered straight, Stipules broad-ovate acute, Leaves of 2-3 pairs of pinnæ, each pinna bearing 8-12 pairs of obl.-lin. leaflets, Peduncs rather longer than lvs, Bracts small, Legume lin.-fal. scab.
21214 Stems prostrate compressed, Leaves with 2-4 pairs of pinnæ, and each pinna bearing 12 pairs of leaflets, Peduncles bracteate

21215 Prickles scattered, Leaves with 1-2 pairs of pinnæ, and each pinna bearing 7-10 pairs of oblong-liuear obtuse 21216 Spines stipular or wanting, Leaves with 1-2 pairs of pinnæ, each pinna bearing 18-25 pairs of ciliated leaflets, Petiole bearing 1-2 small glands
21217 Spines stipular straight small, Leaves with 1-2 pairs of pinnæ, each pinna bearing 18-20 pairs of linear lits, Gland small on the petiole between the pairs of pinnæ, Spikes cylindrical sessile
[flexedly divaricate
21218 Phyllodia lanceolate-linear ending in a sharp point verticillate, Spikes axillary cylindrical, Branches stiff de-
212.9 Stipules spiny, Phyllodia scattered or verticillate linear-lanceolate 3-nerved ending in a sharp point glabrous glandless, Spikes axillary solitary elongated, Fluwers 4-cleft
21220 Branches angular, Phyllodia very long linear hard striated narrow at base retrorsely hooked at apex glandular above the base, Stipules wanting, Spikes ament-formed twin shorter than phyllodia
21221 Phylludia linear in clusters deep green mucronate glandless, Spikes solitary axillary loose

3333. Prosdpis is a genus of large trees, which require the same treatment and culture as the stove species of Mimdsa or Acacia. The pulp in the pods has a sweetish taste, not unlike gingerbread, or the Spanish Algaroba, or s. John's bread (Ceratonia Siliqua), and is eaten by the inhabitants where the trees grow.

21222 Glab. or resinosely puberulous, Branches angular, Phyllodia long. lin.-subu. flat recurved mucr. 3-nerved with an obscure gland near the base, Spikes usually twin dense on short peduncs cylind., Seps free spatulate
21223 Glabrots but when young downy, Phyllodia subulate teretely compressed many-nerved mutic or uncinately mucronate, Peduncles short solitary or twin. Sepals free narrow spatulate
21224 Phyllodia lin.-spatul. 1-5-nerved rounded and mucronate at apex, Spikes solit, or hairy, Calyx usually 5-lbd
21225 Phyllodia lanceolate-linear falcate striated tapering at base, spikes cylindrical axillary twin nearly sessile
21226 Phyllodia long lanceolate bluntish 3 -nerved and reticulate tapering at base with an obscure gland on the upper margin at base, Spikes twin, Flowers 4 -cleft
21227 Phyllodia oblong-lanceolate obliquely cuneate at base 3 -nerved terminating in a mucrone with one gland on the upper margin, Spikes axillary usually twin
21228 Phyllodia oblong acuminate at both ends i-nerved and feather-veined with one gland in front at base, Heads of flowers racemose
21229 Stipules caducous, Phyllodia ovate-oblong oblique marginate falcate mucronate downy as are the branches, Heads solitary axillary
21230 Powdery, Phyllodia elliptic-obtuse wavy I-nerved terminated by an oblique mucrone, Heads of flws racemose 21231 Glabrous, glaucous when young, Branches triquetrous, Phyllodia obliquely ovate or obovate mucronate coriaceous tapering at base marginate with a gland beneath the middle, Heads racemose on short peduncles
21232 Branches angular, Phyllodia cultriform ending in a hooked mucrone which leans to one side and furnishtd with a gland in the middle on the upper margin 1-nerved, Heads racemose
21233 Branches angular, Phyllodia long linear-lanceolate falcate acute feather-nerved glandless tapering at base, Racemes at first leafy, Heads numerous globose, Legume long linear-terete
21234 Branches angular, Phyllodia obovate-obloug obtuse feather-nerved silky with one gland towards the middle, Heads many-flowered solitary or racemose, Petals clavate ciliated as is the calyx
21235 Branches angular, Phyllodia elliptic ending in a spine-like mucrone 1-nerved and feather-nerved glaucous with a gland on one side, Heads racemose
21236 Glabrous, Phyllodia ovate acute bearing a gland on the upper margin, Heads axillary twice the length of the phyllodia
21237 Erect, Branches slender, Phyllodia linear clammy as are the branches, Heads globular on short stalks axillary solitary or twin
21238 Much-branched glabrous or minutely downy viscid, Phyllodia narrow oblong-lanceolate subfalcate obtuse obliquely mucr. or glandulif. at apex many-nrvd, Peduncs dwny shortly rac. or solit., Heads about 20 -flwd
21239 Arboreous, Branches drooping, Phyllodia lanceolate often 1 foot long glaucous green almost blue, Racemes axillary, Heads globose
21:40 Glabrous or hispid, Branches angular, Stipules setaceously-spinescent, Phyllodia petiolate ovate-lanceolate oblique subulately acuminated wavy, Upper margin often crenated 2-nerved or forked and 2-3-nerved trausversely veiny or retic. with large gland near base, Peduncs simple or shortly rac., Heads few-flwd glab.
21241 Phyllodia green curved 8-9 inches long marginate 1-nerved and feather-veined, Heads racemose, Racs short
21242 Branches and phyllodia straight recurved at top glandless acute terete glabrous, Stipules none, Heads twin or tern pedunculate rising from deciduous imbricate bracts
21243 Greyish, Branches weeping or pendulous, Phyllodia linear-lanceolate arched a little tapering to both ends terminated by a hooked mucrone with one gland in front at base and 2-3 longitudinal nerves, Heads racem.
21244 Stipules acicular twin spinescent. Phyllodia dolabriform smooth terminated by a spine-like mucrone manynerved convex on the upper side and nearly straight on the lower, Branches slightly angular downy, Heads of flowers solitary pedunculate, Peduncles longer than phyllodia
21245 Stipules spinescent, Phyllodia obliquely oblong-lanceolate -nerved rather pilose ending in a hooked mucrone with a gland-bearing tooth on the upper margin, Branches hairy, Heads of flowers solitary or twin
21246 Stipules spinescent, Phyllodis obliquely oblong-lanceolate entire wavy l-nerved, Branches clammy glabrous, Heads solitary
[cronate with one glandular tooth on the upper margin, Heads solit. on short peduncs
21247 Hairy, Brnchs broadly winged, Stips small pungent, Phyllodia short bifarious decurrent obliquely truncate mu21248 Stipules wanting, Phyllodia linear-lanceolate rather falcate tapering at base l-nerved terminated by an incurved callous mucrone clammy as are the branchlets, Heads of flowers twin
21249 Vilious, Phyllodia lanceolate acute stiff nerved falcate ending in a pungent mucrone, Heads twin
21250 Hairy, Stipules deciduous, Phyllodia linear ending in an oblique callous mucrone 1-nerved glandless, Heads of flowers twin on long peduncles
21251 Branches angular puberulous, Stipules scale-formed very minute, Phyllodia on short petioles chliquely rounded obtuse or retuse mucr. with ove gland towards middle on upper margin, Heads glob. solit. on long peduncs
21252 Silky from minute down, Brauches rather angular, Phyllodia obovate or oblong rather oblique very blunt marginate glandless or with one obscure gland i-nerved feather veined, Heads solitary or few shortly racemose many-flowered
21253 Stipules almost wanting, Phyllodia linear-lanceolate many-nerved rather pilose mucronate, Heads solitary
21254 Stipules almost wanting, Phyllodia oblong-lanceolate obtuse obliquely mucronate tapering at base 3 - 7 -nerved with one gland on the upper margin, Heads solitary
21255 Stipules almost wanting, Phyllodia lanceolate tapering to both ends shining 2 -nerved with a gland on upper margin at base clammy as are the branches, Heads of flowers usually twin
\(2!256\) Glaucescent glabrous or branches and petioles hairy, Leaves with \(2-3\) pairs of pinnæ with a depressed obscure gland on the petiole beneath the pairs of pinnæ, Leaflets 4-8 pairs on each pinna obovate-oblong obtuse obscurely \(2-\)-n-nerved, Heads in racemes, upper ones panicled
21257 Branches hairy, Spines axillary subulate often wanting, Leaves with one pair of pinna, each pinna bearing 3-7 pairs of linear leaflets having revolute subciliated margins, Heads globose solitary

21280 - - toxicària Lesch. poisoncus \& \(\square\) plon ... ... G Java 1844. C s.l.p Horsf. pl. jav. A'rbor toxicaria Ipo mas Rumph.

History, Use, Propagation, Culture,
3334. Slenánthium frigidum is said to be poisonous, and may be supposed to furnish a part of the venomous Sabsailla seeds of commerce from which veratra is obtained.
3335. Phy'élephas is the gemus the nuts of which are the vegetable ivory, now imported to this country in large quantities, so much used by the turners for toys, knobs of umbrellas and walking-sticks, buttons, \&c. It is called Cabezo de Negro in Peru, where the leaves are used for thatch for houses. The young fruit is devoured by bears, The plant has been cultivated by Messrs. Loddiges of Hackney since 1820, and therefore is an old inhabitant of our hot-houses. Whether the plant found on the banks of the Magdalena is the same as the plant from Peru is doubtful, This has also been introduced to Kew Gardens by Mr. Purdie, formerly a collector for that establishment. The substance of the nuts is the hardened perisperm.
3336. Skimmia japónica is a tree generally cultivated in Japan in gardens and around temples. Skimmia, in Japanese, is said to mean a hurtful fruit.
21280. Antiaris toxicaria is the Upas tree of Java and Jpu of Macassar, and is a large lactescent tree with alternate stipulate unequal-sided subcordate costately veined entire leaves, and axillary or lateral drooping peduncles. Many of the older travellers who have visited the islands of the Indian Archipelago make mention of this tree growing in the kingdom of Macassar on the Island of Celebes, and producing a poisonous juice of the most deadly character. The substance of these several statements is, that the natives of Macassar make use of the juice to poison small darts

1258 Branches hairy, Leaves of one pair of pinnæ, each pinna bearing 8-10 pairs of linear-lanceolate leaflets, Peduncles solitary or twin axillary 1-headed, Heads globular
1259 Branches downy and hispid, Spines axillary subulate, Leaves of one pair of pinnæ on a short petiole bearing a pedicellate gland between the pairs of pinnæ, \(L\) aflets \(5-7\) pairs on each pinna lintar glabrous or ciliated on the margins, Heads globose
21260 Silky unarmed, Leaves with 2 pairs of pinnæ, each pinna bearing 2-3 pairs of linear obtuse leafiets, Petioles marginate glandless, Peduncles longer than leaves, Spikes axillary drooping simple
31261 Stem simple leafy, Leaves linear complicate, Flowers large pedicellate racemose hermaphrodite

21262 Stem erect, Leaves usually opposite nearly all hastately triangular with spreading lobes, Perigone ovate-triangular muricate on back scarcely longer than fruit united only at base, Fruit panicled in dense spikes, Seeds black polished and a few dark brown and larger than the others
21263 Stem erect, Leaves oblong-łanceolate irregularly toothed rarely entire, Perigone obcordately triangular obtuse toothed tubercled on the back closed
21264 Leaves alternate obovate eutire glabrous glandless as are the petioles

21265 Leaves oblong-lanceolate entire coriaceous smooth rounded at base rather glaucous beneath, Racemes compound, Fruit hairy in disk, Winge short parallel smooth
21266 Lvs oblong acum. serrulated shining smooth, Corymbs term., Petals cuneated, Wings of fruit diverg. cultriform 21267 Leaves truncate at base smooth and glaucous beneath palmately 5-lobed, Lobes deeply toothed, Flowers apetalous pentandrous conglomerate on short pedicels, Ovaria downy
[9 hairy, Ovaria hairy
21268 Lvs digitately 5 -lobed, Lbs rather 3 -lobed repandly toothed downy beneath, Racemes compound erect, Filaments
21269 Leaves cordate 5-lobed downy beneath short, smooth in the adult state, Lobes ovate acuminate doubly serrated, Serratures awned, Racemes smooth, Wings of fruit diverging
21270 Lvs 9-10-parted, Lobes oblong acuminate deeply serrated or pinnatifid, Umbels 4-6-flowered
21271 Lvs smooth palmately divided into \(5-7\) lobes beyond the middle, Lobes oblong acum. serrated, Umbels 5 - 7 -flwd 21272 Lvs orbic. rather cord. at base 7 -lobed smooth, Lobes acutely toothed hairy at the origin of the nerves beneath 21273 Lvs cordate 5-lobed villous beneath as are the petioles, Lobes ovate acute, Racemes lateral, Petals bearded at apex, Fruit villous with cultriform crenulated wings
21274 Lvs glabrous glaucous beneath and bearded in the axils of the veins suborbicularly cordate 5 -cleft, Lobes obovate cut or toothed acutish, Corymbs nearly sessile nutant in the fruit-bearing state, Pedicels glabrous, Samara glabrous roundish with obovate erectly conniving wings

DIOECIA.
21275 Fronds very long pinnate, Caudex humble, Heads of fruit large
21276 Fronds very long pinnate, Caudex none, Heads of fruit small
[Spadix paniculately branched, Berries globose blue furrowed on one side 21277 Frond digitately many-parted, Petioles unarmed or denticulated, Segments linear bluntish bidentate or bifid, 21278 Frond multifid, Segments bifid at top, Petioles toothed and covered with white scurf above, Partial spathes many, Berries ovate nearly solitary lepidoted furrowed on one side
21279 Lvs alternate crowded towards the tops of the branches petiolate oblong coriaceous entire full of pellucid dots green above and pale beneath, Flowers terminal dichotomously panicled

21280 Segments of male involucrum ovate length of perianth, Leaves oblong-elliptic cordate at base, Heads hemispherical pendulous

and Miscellaneous Particulars.
which are discharged through a tube, so fatal in its effects that a slight wound even in the heel, just sufficient to draw blood, not only produces immediate death but renders the flesh, within half an hour, so putrid as to separate from the bones on the mere application of the hands. "This," adds Bontius, "is no idle invention, but depends on the ocnlitr experience, not only of our own countrymen (the Dutch), but also on the English and French." Tavernier states the poison to be the produce of a certain tree growing on the Island of Borneo, and capable of being so tempered as to shorten or prolong the suffering of the victim. Deschamps describes the tree as having much the halit of an elm tree, having both male and female flowers growing on the same tree; and that the mere atmosphere of the tree is far from being so pernicious as it has been represented, he himself having cut branches from it with impunity. The fables related concerning it, he thinks, may be explained by transferring the odium to the marshy and unwholesome exhalations of the low island on the southern coast, to which, he says, state criminals and especially those of the highest class, are sometimes banished. and where they speedily die of maiaria, not as the vulgar believe of emanations of the Pohon-Upas. He states also that the poison is the inspissated juice obtained by means of incision in the bark, and says that if introduced into the circulation by the slightest wound it proves instantly fatal. a though the natives feed with impunity upon the animals killed by arrows impregnated with the poison. The Antsjar Dr. Horsfield states, is one of the largest trees in the forests of Java, the stem being completely naked to the heipht of 60 to 70 or 80 feet, and the bark white. A puncture or incision beng made in the bark, the juice or sap appears ouzing out, of a yellowish

History, Use, Propagation, Culture,
colour and rather frothy from old trees, but paler and nearly white from young trees; when exposed to the air its surface becomes brown. The consistence much resembles milk, only it is thicker and viscid. The sap is contained in the true bark (cortex), which yields the juice in considerable quantities. The inner bark (liber) is of a close fibrous texture like that of Morus papyrifera, and when separated from the outer bark resembles a coarse piece of linen, and is made into ropes and coarse clothing. It is only when the trees are largely wounded and when felled, by which a large portion of the juice is disengaged, the effluvia of which mixing with the atmosphere affects the persons exposed to it with cutaneous eruptions, and heat and itching of the eyes. The rapidity of the effects of the poison,
[10-celled seated in a campanulate G-lobed calyx 21281 Glabrous, Leaves sessile stem-clasping coriaceous orbicular obtuse or acute, Fruit turbinate woody lo-seeded 21282 Leaves bifarious oblong-lanceolate glabrous, Peduncles axillary on the younger branches, Flowers silky, Male peduncles 3- or many-flowered, Female 1-flowered, Corolla urceolate with a 5-lobed spreading limb those of the hermaphrodite flowers with about 16 stamens and a 5 -lobed stigma
21 283 Lvs large smooth rndsh cord. 3-nerved downy on the nerves beneath sometimes repandiy tthd, Fruit collected in bundles of \(8-12\) near root, turnip-shpd ribbed villous having umbilicus closed by numer. cord. imbric. scales 21284 Lvs broad cord. obt. ser, -crenate 3-nerved downy, Fruit axil. and lat. pedunc. sol, oval smooth. Near F. Cärica 21285 Branches and petioles clothed with rusty tomentum, Lvs broad-elliptic and obovate long-acum, glabrous above but downy beneath with prominent nerves, Fruit soli: ary globose pendulous almost as long as peduncles
21286 Brnchs and petioles rather scaly, Lvs alternate on short petioles elliptic or obov.-ellip. ending in a long bluntish oblique point shining above and rufescent beneath ent. 3-nerved and reticulately veined. Fruit axil. twin or lateral subfascicled globose or ellip. contracted'into a long stipe at base tribracteate, Stipe hispid
21287 Leaves crowded oblong narrowd at base fiddle-shaped 3-nerved entire deep green above puberulous on the nerves beneath
21288 Branches terete hairy at tops, Petioles hairy, Lvs broad-oblong lanc. short acum, tapering to base entire featherveined shining ahove glabrous, Fruit usually twin sessile globose rather depressed covered with silky villi. Habit of \(F\). elastica.
21289 Creeping radicant, Branches subretrorsely villous, Lvs distich alternate on short petioles ovate cordate acutely apiculated entire 3-nerved 4-ribbed on both sides, glabrous above or pilose, villous beneath

and Miscellaneous Particulars.
Dr. Horsfield states, depends in a great degree on the size of the vessels wounded, and on the quantity of the poison arried into the circulation, but in general it is from a quarter to half an hour after its introduction it proves fatal. He regards the convulsions accompanying the action of the poison as a subordinate and secondary symptom, and not is the result of any direct action of the poison upon the brain or nerves, but by rendering the heart insensible to the timulus of the blood and stopping the circulation.
2167. Ficus Roxburghii. The fruit is larger than the common fig, and eaten by the natives in their curries, where he tree is indigenous.
G. D.

The following additional Figures are illustrative of Plants described in Pages 1334. 1355. and 1358.

\title{
SUPPLEMENTARY LIST
}

OF

\section*{PLANTS LATELY INTRODUCED, AND NOT INCLUDED IN THE BODY OF THIS SUPPLEMENT,}

WHICH ARE REMARKABLE FOR THEIR RARITY, UTILITY, OR BEAUTY.

Abèlia uniflòra \(\boldsymbol{R}\). Br., Bot. Mag. t. 4694. An ornamental hardy shrub from the north of China, with blush-tinged Howers, the sepals of the calyx being of a reddish brown.
A'bies bracteàta Hoolc. \& Arnott, Bot. Mag. t. 4740. A very beautiful fir from California, remarkable for the long spiny bracts of its cones. Seeds of this species have been sent home to Messrs. Veitch by their collector, Mr. William Lobb, and numerous plants have been raised.
A'bies Ke'mpferi Lindl. This species forms a beautiful tree, 120 or 130 feet in height, with a deciduous habit. It has been introduced by Mr. Glendinning, and it is supposed that it will prove quite hardy, having been found in the central, northern, and eastern provinces of China.
A'bies Hookeriàna Murray. This exceedingly beautiful A'bies is one of the conifers introduced by Mr. William Murrav of San Francisco, who found it high up in the Californian mountains, about lat. 410 N., where the ground was already covered with snow on the 16 th of October. It is closely allied to A. Pattoniana, but there are distinguishing characteristics. The cones are of a light fawn colour, somewhat of the hue of the cone of the common larch. The scales are larger than those of A. Pattoniana, and are not crenulated. The bract commences to contract near the top. The seed and the wing are longer than in A. Pattoniand, and the wing is entirely fawn-coloured. The tree attains the height of about 50 feet.
\(A^{\prime} b i e s ~ P a t t o n i n ̃ a . ~ T h i s ~ i s ~ a l s o ~ a ~ v e r y ~ b e a u t i f u l ~ s p e c i e s, ~ i n t r o d u c e d ~ b y ~ J e f f r e y, ~ a n d ~ f i g u r e d ~ b y ~ t h e ~ O r e g o n ~ C o m-~\) mittee. Jeffrey describes it as attaining the height of 150 feet, towering over the rest of the forest. The cones are uniformly of a dark brown colour. The scales are at least a third less than those of A. Hookeriàna, and are deeply and firmly crenulated. The bract does not contract near the top. The seed and wing are about oue third shorter than in A. Hookeriana, and the wing has a purplish brown tinge at the top and back.
Acrolíneum ròseum. A beautiful new half-hardy annual from South-West Australia, with everlasting lively rosecoloured flowers. It requires the same treatment as other greenhouse annuals.
Allopléctus chrysánthus. A rather showy species from Colombia, requiring the ordinary treatment of other stove perennials. Flowers golden yellow, with a red velvety calyx. The leaves are of a glossy velvet-like purple on the under side.
Allopléctus Schlímir. A coarsegrowing stove perennial from New Grenada, with violet flowers, which are yellowish below and have a red calyx. The leaves are purplish violet on the under side.
Alonsòa acutifòla \(R . \& P\). A rather pretty greenhouse undershrub from Bolivia, with bright scarlet flowers.
Amomum Daniélli. This is a curious stove perennial from western tropical Africa, and is one of the Mellagetta Peppers. The flowers are red and whitish, tinged with rose and yellow.
Angulòa RGckeri sanguínea. A handsome variety of a beautiful and well known orchid, with flowers of a uniform rich chocolate brown.
Ancectochìlus álbo-marginàtus. A dwarf variegated-leaved terrestrial orchid, requiring a warm damp stove.
Aphelíndra lateritia. A beautiful stove shrub from Guatemala. The flowers are arranged in a cone-like head, and are of a dull scarlet, with the tube yellowish.
Aphelfindra squarròsa Leopóldi. A very showy variegated-leaved soft-wooded stove shrub from Brazil, with very handsome spikes of yellow flowers. The leaves, which are of a deep green, are marked by well-defined broad whitish veins.
Astrocàryon rostrìtum. A noble palm from Brazil, which has fowered in the palm-house at the Royal Botanic Gardens, Kew. The leaves are from 6 to 8 feet in length, and the flowers are whitish.
AzÀlea amge'na Lindl., Bot. Mag. t. 4728. A neat-growing and very pretty species from China, with purplish crimson flowers, the calyx being large and coloured like the corolla. It requires a greenhouse.
Azàlea crispiflòra Hook., Bot. Mag. t. 4726. A very showy plant, differing from other Chinese Azaleas chiefly in the flowers, which are of a rosy crimson, having a crisped margin, which is a very pleasing feature. Introduced from China, and requires the treatment of the greenhouse species of Azalea.
Azàlea índica Beàlei Hort. A very beautiful variety from China, with the flowers striped with bright vermilion on a white ground. An evergreen shrub, very suitable for conservatories.
Azàtea índica narcissiplòra. A curious and, at the same time, handsome variety, with double white flowers, from China, and forming an useful greenhouse evergreen shrub.
Azàlea indica striàta formosíssima. A seedling raised by Mr. Taylor, gardener to J. Coster, Esq., of Streatham, and brought out by Messrs. Veitch and Son. The flowers, which are of good form and substance, are of a pure white, flaked and spotted with light purple; and the habit of growth of the plant is exceedingly good.

BÀhia latifòlia Lindl. A handsome hardy Californian annual, with deep yellow flowers.
Begònia minì̀ta. This is a broad-leaved variety of \(B\). fuchsioides, with vermilion-coloured flowers. Introduced from Colombia, and requiring the treatment of a stove perennial.
Begònia opuliflòra. An ornamental stove undershrub from New Grenada, with pure white flowers, which have golden stamens, produced in heads resembling the Guelder Rose.
Begònia Prestoniénsis. A very beautiful variety of this fine hybrid scarlet-flowered Begonia, named supérba, was exhibited in the summer of 1854 . It is, like the original, a very showy plant.
Bérberis concínna J. D. Hook., Bot. Mag. t 4744. A very pretty hardy shrub from the Sikkim Himalaya, with small spiny-edged leaves and yellow fiowers, which are succeeded by oblong scarlet berries.
Billbégia bifrons Lindl. A showy dry-stove perennial from Brazil. In one variety the flowers are of a fiery red, while in another they are of a whitish yellow.
Borònia Drummóndi Hort., Planch. Flore des Serr.ix. t. 881. This is a charming little shrub from the west coast of New Holland; the flowers are of a beatiful rose colour, with a balsamic odour. It requires only a moderate greenhouse, and is easily multiplied by cuttings.
Brassavòla lineàta Hook., Bot. Mag. t. 4734. An ornamental stove epiphyte from South America, with large white flowers, the sepals being tinged with yellowish green and red.
Bravòa geminiflòra La Llave et Lex., Bot. Mag. t. 4741. This is a very beautiful Amaryllidaceous plant from Mexico, where it is found, according to La Llave and Lexarça, growing on the mountains of Valladolid and Miciciacan. It has a tuberous root, and is easily cultivated in a warm greenhouse, where it blossoms in July. The flowers, usually geminate in the upper part of the raceme, are very graceful, always drooping, and of a rich orange-red.
Brillantaísta owarténsts Palis. de Beauv., Bot. Mag. t. 4717. Acanthaceq. This plant in its habit of growth resembles some of the largest species of Sálvia; the flowers are of a violet blue. It is a native of Sierra Leone, whence it was introduced in 1853.
Búddeea crispa Benth., Bot. Mag. t. 4793. A native of the Himalaya, much hardier than the common kinds: the leaves are heart-shaped at the base, and covered on both sides with a thick whitish down; and the flowers are of a pale violet. It was introduced by Major Madden.
Bry \({ }^{\prime}\) E'benus Dec, Under this name is figured in the Bot. Mag. t. 4670, the well known Jamaica Ebony, which is given in p. 604. No. 10,034, under the name by which it was formerly known, viz. Amerimnum E'benus.

Calcelolìria ericöides Vahl. A curious half-hardy subshrubby species from Colombia, with small yellow flowers.
Calceolària hyssopifolia \(H\). B. et Kunth. An elegant half-hardy undershrub from Quito, the flowers of which are white and yellow.
Calceolìrıa violìcea. A half hardy shrub from Chili, having a novel and interesting appearance. The flowers are of a dull violet.
Calyptrìria hemántha Planch., Flore des Serr. ix. t. 924. Melasfomacece. A magnificent plant, nearly allied to Medinílla magnifica: the flowers are large, of a dark purple, with long white anthers, it is a native of New Grenada, and requires only a moderate stove.
Campanumeea lanceolàta Sieb. \& Zucc., Flor. Jap. 1, 174. Campanulàceæ. A curious perennial plant found in Japan, with greenish flowers, requiring protection during winter.
Cassiope fastigiàta. A charming little hardy evergreen shrub from the Himalaya, requiring a cool, moist, peat soil. The leaves are closely imbricated in four rows; the flowers are drooping, white, and bell-shaped.
Cattleya lutèola. A rather pretty small-fiowered epiphytal orchid from Brazil. The flowers are of a clear yellow.
Ceanòthus floribúndus. A beautiful hardy evergreen shrub from California, having a good habit. The flowers are of a rich deep blue, and are produced in deuse globular heads, which are thickly studded over the branches and branchlets. Introduced by Messrs. Veitch through Mr. Lobb.
Ceanòthus Lobbì̀nus. This is another of Mr. Lobb's introductions from California. It is a distinct and showy hardy evergreen shrub, with deep blue flowers, which are produced on stalked oblong or roundish heads.
Centropògon tovariensis. A very handsome stove perennial from Venezuela, with beautiful rosy-crimson flowers.
Ceratostèma grandiflòrum Ruiz \& Pav., Bot. Mag. t. 4479. A small shrub, a native of the Andes of Peru, extremely elegant in its appearance, and remarkable for the beauty of its flowers, which are of a reddish-orange, and bear considerable resemblance to those of Cāntua depéndens.
Cercis Japónica Van-Houtte, Flore des Serr. viii. p. 269. t. 849. A species of the Judas-tree, with leathery leaves and an abundance of flowers. It is a native of Japan, and is perfectly hardy in this country.
Cereus Lemaírit. This is a very fine new bright-blooming species, which is reported to have been introduced from Antigua. The flowers are very large, being twelve inches long and nine inches broad, on the outside yellow tinged with red, and white inside. The plant, which has a straggling habit of growth, requires a dry stove.
Cèreus Macdonáldife Hoole., Bot. Mag. t. 4707. A magniffcent species of Cèreus from the Honduras, nearly allied to C. grandifidrus, and flowering in the night, like that species.
Cerochìlos rùbens. An orchid of no greát beauty, allied to Physùrus. The flowers are greenish with pink bracts. The plant requires the treatment of stove perennials. It is supposed to be from the East Indies.
Ceropègia Thwaifèsir. A botanically interesting stove climber from Ceylou, with the flowers green and brown.
Cestrum Regèlii Planch., Fl. des Serres, ix.t. 946. ; Habrothámnus aurantiacus Regel. This very elegant shrub, which is quite different from C. aurantiacum, is a native of Central America, and Howered for the first time in Europe in the Botanic Garden at Zurich in 1850.
Chetogístra Lindeniǹa. A very ornamental species from the alpine districts of the Andes of Colombia, and requiring a cool stove or greenhouse. The flowers are large, and of a blackish purple.
Cherranthéra lineàris. A handsome greenhouse shrub from New Holland, with violet-blue flowers.
Chionánthos retùsus. A shrub with white sweet-scented flowers, from China, which will probably prove hardy in this country.
Clématis barbellàta Hook., Bot. Mag. t. 4794. A very beautiful species from the Himalayas, introduced by Major Madden, which flowered for the first time in Europe in the Glasnevin Garden in 1854. The flowers are violetcoloured, with the edges of the sepals marked with white.
Cúmatis coriàcea Dec. This is a showy greenbouse climbing species from New Holland, with large panicles of white flowers.

Clematis lanuginosa pillida. A variety with much paler flowers than the species. While in the species the flowers are blue, in this variety they are greyish, almost white. A hardy climber, from the north of China.
Clématis Pàtens. This is the correct name for the species which in England is generally called C. carulea. A fine large-flowered variety of it, called "Sophia," has recently been raised, having a broad green band down the sepals of the calyx.
Clerodendron BGngei. When well cultivated, this forms a showy shrub, somewhat resembling the single-flowered C. frigrans. It is from the north of China, and has rose-coloured flowers.

Cglógyne panduràta. A fine stove epiphyte from Borneo, introduced by Messrs. Low, of Clapton. The flowers are large and of a pale green, the lip being of a yellowish green with broad black veins and stains.
Còleus Blùmei Benth., Bot. Mag. t. 4754. The leaves of this species, which forms an undershrub requiring a stove, are curiously and beautifully variegated with dark chocolate on a pale green. The plant is a native of Java, and produces its purple and white flowers in whorled racemes.
Comaclínium aurantìacum. This is a showy subshrubby greenhouse species from Central America, with brilliant oxange-scarlet flowers.
Coutarèa diervillöldes. A very showy stove shrub from Colombia. The flowers, which resemble those of the beautiful Weigela josea, are white inside and pink on the outside, and they are produced in rich terminal panicles.
Crossándra flàva Hook., Bot. Mag. t. 4710. A rather weedy-looking stove undershrub from Sierra Leone. The foliage is somewhat coarse, and the flowers, which are yellow, are sparingly produced and of short duration.
Cupréssus Lawsoniana. This was the handsomest tree seen during the whole of the expedition under the direction of Mr. William Murray of San Francisco, for exploring the range of mountains which runs between the coast range and the Rocky Mountains, lat. \(40 \circ, 41 \circ, \& c\)., N. "It was found on the banks of a stream in a valley on the mountains, attaining the height of 100 feet, with a stem 2 feet in diameter. The foliage is most delicate and graceful. The branches spread upwards like a Spruce Fir, and hang down at the tips like an ostrich feather, the top shoots drooping like a Deodar. The timber is good, clear, and workable."
Cupréssus Macnabiàna. "This is the same species as one sent home by Jeffrey, without a name, and distributed by the Oregon Committee in 1852. The cone is about the size of a hazel nut, with hard scales, having a projecting umbo in the centre." The plant is of low growth, and very suitable for a shrubberg.
Cy'clamen macrophy'lum. An ornamental very large-leaved species from Algiers, with pink and rose-coloured flowers, requiring the treatment of a greenhouse tuberous-rooted perennial.
Cymbidium péndulum atropurpureum. A variety of the well-known orchid C. péndulum, with deep purple flowers, the lip being ribbed with yellow. Introduced from Borneo, and requiring to be treated as a stove epiphyte.
Cypripedium villòsum. This fine showy orchid, which in some degree resembles \(C\). insigne, was introduced from Moulmein by Messrs. Veitch and Son. The flowers are green, brown, and purple; and the plant requires the treatment of a stove perennial.

Dbndròbilm cymbidiöìdes Lindl., Bot. Mag.t. 4755. An epiphytal orchid from Java, with ochreous yellow and not very showy flowers.
DendròbiUm macrophy'llum gigantèum. This is a very showy plant, with light rose-coloured flowers, which are considerably larger than usual. Obtained from the Continent by Messrs. Veitch and Son.
DichorizAndra leucopithálmos Hook., Bot. Mag. t. 4733. An interesting stove perennial from Brazil, the flowers of which are of a deep blue with a white eye, and are produced in radical panicles.
Dichorizándra pícta. This is a very neat and pretty stove perennial, introduced by Messrs. Low and Co., and said to come from Brazil. The leaves are longitudinally blotched with brown on the upper side, and are pink on the underside. The flowers are white and purple.
Dictyánthus Pavònii Decaisne, Bot. Mag. t. 4750. A somewhat curious stove climber from New Spain, with rather dingy Stapelia-like flowers, which are greenish and marked with concentric pale-brown lines.
Didymocárpus Humboldtiàna Gardn., Bot, Mag. t. 4757. A pretty little plant, with pale violet flowers, introduced from Ceylon by Mr. Thwaites, in 1853.
Dibrvílla amábilis Carr., Flor, des Serres, t. 855 ; Weigèla amábilis Hort. A very handsome shrub, a native of Japan, nearly allied to Weigela ròsea.
Diervilla Middendorfiàna. This is the plant which is called the yellow Weigèla. It is a hardy shrub with prim-rose-coloured flowers, which are about half the size of those of Weigela ròsea. Continental nurserymen received the plant from Russia.
Dioscòrea Batàtas Dec.; D. japónica Hort. This new Chinese yam, which promises to be one of the most valuable vegetables introduced since the potato, differs from the D. japónica of Humb., with which it was at first confounded. The edible part is a long tuberons rhizoma, which, when cooked, is white, extremely farinaceous, and almost destitute of woodv fibre ; in fact, it is only to be distinguished by the shape from the best kind of potatoes. The plant is perfectly hardy; and M. Vilmorin, who has cultivated it on a large scale near Paris, finds its produce enormous. The only difficulty is, that the long tubers penetrate deeply into the ground, and are troublesome to take up; and on this account the plant is generally grown in trenches, so that the tubers may extend horizontally:
Diotostèmon Hoóкeri. A succulent greenhouse shrub from Mexico, resembling a species of Echevèria. The flowers are of a yellowish red.
Dipladènia flàva Hook., Bot. Mag, t. 4702. A showy climbing shrub from New Grenada, requiring a stove. The flowers, which are produced in May, are large and of a rich yellow, resembling those of a species of Allamánda.
Dracas"Na blliftica maculàta. An evergreen stove shrub from Java, with variegated leaves and greenish flowers. Very ornamental in the habit of its growth.

Echites Pellètr. This is a synonyme of Neriándra suberécta, which see.
Embóthrium lanceolàtum. A fine evergreen Proteaceous shrub from Chili, which will probably prove half-hardy in this country. It is allied to Telopèa.
Epíscia melittifòlia Mart., Bot. Mag. t. 4720. A rather coarse-growing stove perennial from the West Indies, with tall stems, large leares, and small red flowers, which are produced in March and April.
Eriógonum compósitom Dougl., Bot. Mag. t.4703. This is a hardy perernial, of botanical interest, from Oregon, having rather a weedy appearance. It produces its small yellowish-white flowers in great abundance.
Escallònia dénsa Linden. A pretty greenhouse shrub from Merida, producing numerous pinkish-white flowers.
Eschschóltzia tenuròlia. A very pretty hardy annual from California, with a compact and dwarf habit. The flowers are yellow, and an inch across. Introduced by Messrs. Veitch and Son.

Evgenia oneöides. An evergreen greenhouse shrub, having a very graceful appearance. The flowers are white, and are produced in axillary panicles. It does not appear to be known whence the plant has been obtained.
E'xacum macránthum. A beautiful stove annual or biennial (probably an annual) from Ceylon, with rich deep. purple flowers.

Fráxinus dipétala. A fine hardy tree from Mexico, with purple branches, green leaves, and elegant white flowers.
Fritillària oxypétala Royle, Bot. Mag. t, 4731. A pretty half-hardy bulbous perennial from Kumaon. The flowers are of a purplish-lilac, with purple dots near the centre, and are produced in June.
Fuchsia Dominìina. This is a fine hybrid, raised in the nursery of Messrs. Veitch and Son, at Exeter, by the foreman of the houses there, in compliment to whom it is named. In it the distinguishing characteristics of the two beautiful species \(F\). serratifolia and \(F\). spectribilis, may be said to be combined; for it has the foliage of the former, with the flowers very much resembling those of the latter species. Moreover, it is very valuable for the conservatory, as it blossoms during the winter months, a period of the gear when generally there are so few plants in flower.
Féchsia violeflòra plèna. This is a beautiful new double purple variety, raised by Messrs. Lucombe, Pince, and Co., of the Exeter Nursery, with a rich purplish-blue corolla, resembling a fine double violet.
Fuchsias with a white corolla. Some very beautiful hybrids, with the corolla of a beautifully pure white, are just being brought out by Messrs. E. G. Henderson and Son, of the Wellington Nursery, St. John's Wood, London, and Messrs. Lucombe, Pince, and Co., of Exeter. These were raised by the late W. Storey, Esq., of Newton, in Devonshire, an energetic hybridiser, who, by well-directed efforts, succeeded in obtaining, after two or three generations of seedlings, varieties of improved form, good substance, and excellent habit of growth. One of these hybrids has a pure white corolla, with brilliant scarlet sepals, which are finely reflexed; while another has a pure double white corolla, resembling a fine large double Snowdrop, the sepals being of a rich scarlet

Galeándra Baúeri flóribus lùteis Huok., Bot. Mag. t. 4701. This pretty epiphytal orchid from South America has drooping bunches of deep yellow flowers, the lip being marked with crimson dotted lines.
Gardènia globòsa. This is a neat evergreen greenhouse shrub from Caffraria, with fragrant white flowers.
Geissomèria nítida Nees. An ornamental stove undershrub from Brazil, with brilliant scarlet flowers.
Gentiàna Fortùni. An exceedingly beautiful herbaceous plant, the flowers of which are of a deep blue, spotted with white. It is from the north of China, and it is considered that it will prove quite hardy.
Gésnera Donckelaarì̀na. This is a beautiful hybrid, which is said to have been raised in the Ghent Botanic Garden, between Gésnera díscolor and Gloxinia rubra. The plant is very showy, bearing panicles of rich crimson Gloxinia-like flowers.
Gília lùtea. See Leptosìphon lùleus.
Goldfossia glomerìta speciosa. A showy, although a coarse-growing, soft-wooded stove shrub from Sylhet, the flowers of which are of a deep purple.
Gomphrèna coccínba. An ornamental perennial from Mexico, requiring a warm greenhouse, and the treatment usual for tender annuals.
GoNólobus PYRRHótrichus. This is rather a coarse-growing, though curious stove climber, from Brazil. The flowers are of a dull green, with obscure netting and fine bright yellow coronal teeth.
Gymnostàchyum zeylónicum Arn. et Nees, Bot. Mag.t. 4706. A stove perennial from Ceylon, with variegated leaves, having milk-white stains upon a dark green ground. The flowers are white, tipped with green and yellow.

Hemínthus insignis Hook., Bot. Mag. t. 4745. A very showy greenhouse bulbous plant from Natal, with crimson flowers, which are produced in large heads surrounded by leafy bracts.
Hedaroma tulififerum. This promises to be a valuable greenhouse evergreen shrub. It resembles a broad-leaved Diosma. The beauty of the plant consists in the involucre surrounding the flowers: this is cup-shaped, and of a greenish-white stained with dull red. The plant is from New Holland.
Hédera glomerdlìta. This is a curious evergreen stove shrub from Java. It is very elegant when in flower, though the flowers themselves are green and inconspicuous.
Hexacéntris mysorénsis lùtea. One of the many beautiful introductions of Messrs. Veitch and Son. It is a showy evergreen stove climber from India, with large yellow flowers, which are produced in pendent racemes.
Hippeístrum formosíssimum. A very showy stove bulb, the flowers of which are of a deep crimson, resembling in colour the Jacobean Lily, but being larger and of the form of \(\boldsymbol{H}\). villàtum.
Hólcus saccharìtus Hort. ; Andropdgon saccharàtus Kunth; the Chinese sugar-cane. This plant, though of very recent introduction into this country, appears to have been first sent to Europe nearly a century ago, as it is mentioned in the Bon Jardinier for 1855 , from which the following account is extracted, that a Chinese plant apparently identical with it was used in the fabrication of sugar at Florence, in 1766, by Pietro Arduino; it appears, however, to have been soon lost, as no other iraces have been discovered of it. The present plant has the habit of growth of the maize or Indian corn, and it forms a tuft of eight or ten stalks from each root. The flowers, which are in conical panicles, are green at first, but afterwards become purple. The plant, which is an annual, appears quite as hardy as the Indian corn, and it should be sown in a light rich soil, about the same time as the first sowing of kidney-beans. Juice is found in abundance in the pith of the stalks, and it produces sugar and alcohol, like the juice of the true sugar-cane. The leaves also furnish an excellent forage, and a kind of cider is made from the young or impertectly ripened shoots. The importance of this plant, if only a part of the qualities attributed to it prove correct, can hardly be overrated, not only as regards the sugar, which is about a third more than is produced by an equal weight of beet-root, but with regard to the alcohol, which is in the proportion of 63 to 3 equal weights of the Hólcus and the Beet-root.
Hoy'a fraterna Blume, Bot. Mag. t. 4684. This very fine, new, and distinct species of Hoýa was first detected in Java by Blume : subsequently it has been found by Mr. Thomas Lobb, and sent by him to Messrs. Veitch and Son. It is a climbing stove plant with leaves remarkable for their great size, firmness, and thickness. The flowers are of a pale yellowish buff colour, and are produced during a great part of the summer and autumn.
Hydròlea azùrea. A pretty little greenhouse branching perennial plant from Mexico, profusely covered with beautiful azure flowers, against which the stamens stand out like little stars.
Hypéricum oblongifòlium Choisy. A handsome and, it is said, a hardy shrub from the East Indies, with reddishyellow flowers.
Hypóxis latifòlia. An interesting bulbous or tuberous-rooted greenhouse perennial from Natal, with star-shaped yellow flowers.

Illaírea canarinoldes Lenn. \& Koch, Fl. des Serres, t. 913. Lodsea. A splendid climbing plant from Central America, with orange-scarlet fiowers as large as those of the Cobo'c. It is half-hardy, and may be propagated by cuttings or by seeds, which it ripens freely.
lmantophy'llum miniàtum Hook., Bot. Mag. t. 4783. Amaryllidàcea. Introduced in 1854 from Western Africa, with crimson or rose-coloured flowers, as large as those of a Crinum.
impàtiens Hookeriàna Arn., Bot. Mag. t. 4704. A lovely Balsam from Ceylon, which blossomed in the stove at the Royal Botanic Gardens, Kew, in the summer of 1852. The leaves are large and glabrous; and the flowers, which are of a pure white witn deep blood-coloured veins on the lower portion, are the largest of any known species.
Impגtiens Jerdonni天 Wight, Bot. Mag. t. 4739. This is a very beautiful species received from the Neilgherries, at the Royal Gardens of Kew, in 1852. It has a neat dwarf habit, is of easy cultivation, requiring the temperature of a warm greenhouse or stove, and continues to produce a profusion of its large and strikingly formed flowers, which have a mixture of green, bright red, and yellow in them, for several months. Messrs. Veitch and Son have succeeded in raising a good supply of this charming little Balsam.
I'nga ferrugínea. A beautiful stove shrub from Brazil, with the flowers crimson shading off to pink.
Ixòra Lóberi. This handsome Ixora is one of the numerous beautiful plants received by Messrs. Veitch and Son from their collector Mr. Lobb, in compliment to whom it is named.

Kniphófia Uvària. This is an old name, proposed to be revived for a Cape plant bearing a dense ovate cylindrical head of rich orange or scarlet flowers, and forming one of the handsomest of border plants, introduced long since, and known as Tritoma.
Lachenalia aúrea. This is a very handsome greenhouse bulbous plant from the Cape of Good Hope, with tubular pendent flowers, which are of a deep orange-yellow.
Laurèlia aromática. A handsome fragrant fleshy-leaved evergreen shrub from the mountains of Chili. Introduced by Messrs. Standish and Noble, who are not able as yet to speak positively as to its hardiness.
Lepachys columnàris Dec. Compósita. A native of Texas, nearly allied to Rudbéchia.
Leptosìphon ciliàtus Benth. A rather pretty hardy annual from California, the flowers of which are rose.coloured, with a yellow throat.
Leptosìphon lùteus Benth.; Gilia lùtea Steud., Bot. Mag. t. 4735. This highly ornamental dwarf half-hardy annual, was introduced in 1852 by Messrs. Veitch and Son, through Mr. William Lobb, from California. The unusual length and slenderness, in conjunction with the colour, of the corolla, which is of a bright sulphuryellow, with a dark, almost orange-coloured eye, and the great quantity of flowers produced on the stems and branches, render this plant extremely ornamental, especially when cultivated in beds in masses. There is a variety called L. luteus oureus, the flowers of which are of a deeper colour than those of the species.
Liboceddrus decGrrens Torrey. This is a newly introduced species of this fine genus of conifers. It is in the possession of Messrs. Lawson and Son, of Edinburgh and London. By some it is thought to be synonymous with the rare Thuija gigantèa.
Lílium gigantèum Wall.; L. cordifolium Don, Bot. Mag. t.4673. For the discovery of this noble plant, which may justly be called the Prince of Lilies, we are indebted to the exertions of the late Dr. Wallich, who detected it in moist shady places on Sheopore in Nepal. "This majestic lily," observes Dr. Wallich, "grows sometimes to a size which is quite astonishing; a rruit-bearing specimen of the whole plant, which is destined for the museum of the Honourable East India Company, measures ful ten feet from the of the common White apex. Nor is it found to aportionably large and for flowering plants have attained a height of ten feet in one season the flower portion occupying twenty inches. Such a raceme of flowers, accompanied by bold heart-shaped leaves ten or twelve inches long and eight inches broad, cannot but afford a striking spectacle. The flowers are white, or rather cream-coloured, marked with purplish-crimson. The plant should be treated as a greenhouse half-hardy bulb. It produces seed abundantly.
LimNÁNThes sulphùrea odorìta. A new and beautiful hardy annual, with a rather dwarf bushy habit of growth and very suitable for pot culture as well as for the open border in the flower garden. The lower half of the petals is of a deep sulphur colour, while the upper half is of a beautifully pure white, and there are rosy pink markings down each petal, which are darker near the base than at the apex. The filaments of the stamens are also of a rosy pink. The flowers are larger than those of either of the other kinds of Limnánthes, and delightfully fragrant.
Littònia modésta Hool., Bot. Mag. t. 4723. Uvularièe. A native of Port Natal in Western Africa. It produced Its fine orange-coloured flowers in the Kew Gardens in April 1853, only three months after the planting of the tubers.
Lobèlia Ghiesbréghtit. A rather pretty Mexican greenhouse perennial with red flowers, which continue expanding in succession the whole of the summer.
Lomària chilénsis. This is a fine robust-looking and ornamental hardy fern from Chili.
Lopèzia Macrophy'lla Benth. ; L. grandifldra Fl. Bot. Zeit.; Jèhlia fuchsiöides Hort. Germ., Bot. Mag. t. 4724. An ornamental greenhouse undershrub from Mexico, with bright-red fuchsia-like flowers, which are produced in March. The root is said to be tuberous and fleshy.
LycÁste costàta. A large-flowered epiphytal orchid from Peru. The colour of the flowers is green with a yellowish-white lip.
Lysimàchia Leschenabutir. This is a pretty plant, and it is found to be very useful for planting in the flower garden, as well as suitable for being grown in pots. It is a half-hardy undershrub, a native of the Neilgherries, whence it was introduced by Messrs. Osborn and Son, of the Fulham Nursery. The flowers are rose-coloured, and are produced in deuse racemes.

Maránta Warscewíczir. This is a stove perennial from Central America, remarkable for its finely variegated leaves, which are of a deep green, marbled with grey about the midrib, and purple on the underside. The flowers do not appear to be known.
Marcetia andícola Linden. Fl. des Serres, t. 914. Melastomàcea. A beautiful little shrub from the mountains of Venezuela, with leaves like those of a myrtle, and rose-coloured fowers, which it produces in great abundance. It only requires protection from frost.
Marsdènia lùcida. This is a robust-growing climbing plant from the Himalayas, with rather dingy purple fowers, and fine thick foliage. In Ireland it has proved to be hardy.
Mathigùa galanthöides. A rather diminutive stove bulb from Peru, with the habit of a Snowdrop. The flowers, which are erect, are white tipped with green.

Maxilidiria hirtilabia Lindl. A showy epiphytal orchid from New Grenada, the flowers of which are yellow
stained with purple.
Meriana macrántha. This is an ornamental stove shrub from Venezuela. The habit of growth is compact and neat, and the fiowers are scarlet.
Methónica viréscens Plántir. This is the Gloriosa Plántii of English gardens. It is a native of Natal, and is curious and showy. The flowers are orange-coloured. The plant should be treated as a warm-greenhouse tuberous-rooted perennial.
Metternichia príncipis Mikan; M. prínceps Miers; Lisianthus ophiorrhiza Vell., Bot. Mag. t. 4747. This is a new genus from Brazil, belonging to Solanacee, which has been named in compliment to the Austrian Prince Mettervich. In its native country it attains the height of twenty-five feet. In England it must be regarded as a cool-stove shrub, and as flowering in August. The flowers are large and funnel-shaped, though nnt very showy, their greatest charm, perhaps, consisting in their being powerfully and deliciously fragrant. They are white, with the tube greenish.
Monócera grandiflòra Hook., Bot. Mag.t. 4680. This is the new name for Elcocárpus grandiflora Smith; syn. E. lanceolàta Blume: a handsome evergreen stove shrub from Java.

Neriándra suberecta. This is a fine showy stove climber with yellow flowers, which has been recently re-introduced from France under the name of Echites Pellieri.
Nycterínia selaginöides. A pretty greenhouse annual from the Cape of Good Hope, with a dwarf spreading habit. Introduced by the Horticultural Society of London. The flowers are white, with a deep yellow eye, and they are produced in corymbs.

Odontoglóssum Ehrenbergit. A very neat and pretty epiphytal orchid from Mexico. It resembles, in some degree, \(O\). Róssii. The lip and petals are white; the sepals are of a greenish-yellow and spotted.
Oncídium ionósmum. A beautiful species with yellow flowers, the sepals and petals being spotted with brown. The flowers have a delightful fragrance resembling that of violets.
OnciditM refléxum cessium. This is a glaucous-leaved variety of \(O\). refléxum, bearing the name of \(O\). ca'sium in the German gardens.
Oncídium umbròsum. A species from New Grenada, with unattractive flowers, which are green and dull purple.
PapAver pilòsum Smıth; P. olympicum Sibth. MSS., Bot. Mag. t. 4749. This is a hardy herbaceous Poppy, with, it is believed, perennial roots, the flowers of which are large and handsome and of a brick-red colour, with a pale, nearly white, spot at the base of each petal. It is said to be from Greece, but when or by whom introduced into this country, there is no record.
Pentas cárnea ròsea. This is an improved variety of the well-known Péntas cárnea, which has been imported by Messrs. Osborn and Sons, of the Fulham Nursery, and which has much deeper coloured flowers, of a rosy tint.
Phacella ramosissima Benth. A hardy annual from California, with unattractive dull white and violet flowers.
Phry'nium micans. This is a stemless stove perennial from Peru, with dark-green leaves, having a central longitudinal streak of whitish red, while the underside is of a dull brownish red. The fowers are white, with rosy bracts.
Pincknèya ionántha. A fine stove shrub from New Grenada, with dark violet flowers and a purple calyx, which is divided so as to resemble a stalked petaloid leaf.
Pinus Beardslèyi Murray. From the description given of this new pine (which is one of those introduced by Mr. Murray, of San Francisco), it would appear more nearly to resemble P. Benthamiana than any other described species. The cone, however, is not so long, being only three inches in length, while the leaves are only six inches in length. The sheath of the leaf is short, being only an eighth of an inch. Both the wing of the seed and the seed jtself are neither solong nor so large as in \(P\). Benthamiana. The timber of \(P\). Beardsleyi is homogeneous all through. "The tree is of great beauty and size : one that was cut down measured 123 teet in height and 44 inches in diameter at the stump. Another tree next it measured 17 feet 4 inches in circumference, at 3 feet from the ground. The stem was a very handsome column, about 30 feet to the first branch; the timber good and clear. It was found on the top of the mountain, at the same altitude as \(P\). Jeffreyana, \(P\). montícola, and P. gránris, and higher than either P. Benthamiana or P. Lambertiàna." The species has been named in honour of A. F. Beardsley, Esq., who accompanied Mr. Murray in his expedition.
Pinus Craigiǹa. This is a Pine which also bears some resemblance to \(P\). Benthamidna as well as to the preceding species ( \(P\). Beardslèyi), from which, however, it differs in having the prickle of the scale pointing towards the tip instead of the base: the prickle, too, in \(P\). Craiziana is strong and firm, while in P. Beardslèyi it is small and weak; and the excrescence on the exposed part of the scale is much more developed in the former than in the latter species, which has the exposed part somewhat flat, while in P. Craigiana the upper nart projects considerably over the lower. "The wing of the seed of \(P\). Craigiana is shorter and relatively broader: the seed is nearly twice the size of that of \(P\). Beardsleyi, although the cones are about the same size. The leaf of \(P\). Craigiana is also very distinct from that of \(P\). Beardsleyi; it is much finer and not so long, while its sheath is considerably longer and more delicate. This species was found in the same mountains as \(P\). Beardsleyi, but one-fourth of a mile further down, though higher up than \(P\). Benthamiana. It spreads its branches wider from the stems than P. Benthamiana, and sheds its seed a month later. This Pine has been dedicated to Sir William Gibson Craig, who has done so much for the introduction and cultivation of this valuable family."
Pìnus Jepfreyìna. This is a hardy Californian Pide in the possession of Messrs. Low and Co., of Clapton, of which very little is at present known.
Pinus Parryàna. Another hardy Californian Pine, respecting which also little is known. Also in the nursery of Messrs. Low and Co.
Pinus Royleana. A new Indian two-leaved Pine, with small cones, named in honour of Dr. J. Forbes Royle. It is supposed that the species will prove quite hardy in this country, from its having been found growing in Nepal at an elevation of from 8,000 to 10,000 feet. Introduced through the Horticultural Society of London.
Pitcaínnia echinàta Hook., Bot. Mag. t. 4709. In a flowerless state this curious stove perennial may be said to be stemless; the leaves, which are two or three feet long, being all radical, as in the common Pine-apple. The sepals of the calyx are red and yellow, and covered with prominent glands : the petals are white or creamcoloured, and twice as long as the sepals. The piant is reported to have been intruduced from Mexico. It flowered for the first time in England in January, 1853, and continued a long time in blossom.
Pitcaírnia longtròlia. This is an ornamental species from Lima. It is a stove shrub, with an erect elongated stem, and branched panicles of scarlet flowers.
Pitcafrnia macrócalyx Hook., Bot. Mag. t. 4705. This is a South American species, coming nearest to \(P\). suaveolens, but quite distinct. It has the largest calyx of any known species, and it is altogether a fine-looking plant. The sepals of the calyx are yellow : the petals are large and white, and thrice as long as the calyx. The plant requires a stove, and it dowers in December.

Pitcafrnia muscòsa. This is a Brazilian species,forming a pretty and lively winter-blooming plant. It is a stove perennial with red flowers.
Pitcaírnia nubigena. A showy stove perennial from Venezuela, with the flowers rose and scarlet."
Pittósporum crassifòlium. This is a fine greenhouse evergreen shrub from New Zealand, with crimson flowers.
Pittósporum flàvum. A very fine showy species from East Australia. It is a greenhouse evergreen shrub with large yellow flowers, which are produced in large corymbs.
Plumièria Jamesòni Hook., Bot. Mag. t. 4751. This handsome stove shrub is named in honour of Professor Jameson, by whom it was found in the vicinity of Guayaquil. "Its great beauty consists in the fine red of the peduncles and pedicels, and outside of the flower, and the rich yellow of the upper or inner side of the corolla, and which, together with the great breadth of the lobes of the corolla and their acute apices, constitute the chief specific distinction." In these particulars no other species is found to accord with it. The plant flowers in the stove in July.
Podólepis chrysántha Endlicher. A showy half-hardy anıual from New Holland, with golden yellow flowers.
Posoquèrta reyolùta Nees. This beautiful Brazilian stove shrub has recently been introduced by Messrs. Veitch and Son. It has fine laurel-like leaves, and clusters of graceful snow-white flowers, the tube of which is more than three inches long. "The specific name," Dr. Lindley observes, "was given upon the supposition that the leaves have their edges rolled back, but this occurs in so slight a degree as to cause regret that so fine a plant should not bear a more characteristic title."
Primula mollis, This is a very handsome hardy or half-hardy perennial species, with the habit of \(P\). cortusolides. It has been introduced from the Mountains of Bhotan, and it has deep rose-coloured flowers.
Psammisia penduliflòra Dec. Ericdcea. A handsome low-growing cool-stove shrub from Venezuela, probably belonging to the genus Thibaudia. The flowers are vermilion, with yellowish green. \(P\). sarcantha Dec. is another dwarf shrub from the same country.
Psammísia sclerophy'lla. This is a showy stove shrub from Venezuela, with tubular drooping crimson flowers, which are tipped with yellowish white.
Pùya chilénsis Molina, Bot. Mag. t. 4715. This is from North Chili, and is one of the most striking of Bromeliaceous plants. The stem, or caudex, of a plant in the Royal Gardens of Kew, has now attained a height of four feet, independent of the leaves, which are from three to four feet in length, spreading in all directions, the lower ones being reflexed. "The compound spike of flowers upon the column-like perfectly straight peduncle, is remarkable for its size; the large full yellow (but inclining to green) flowers and the copious bracteas turning brown or black in age." This plant is called Cardon and Puya in Chili, where the soft substance of the stem is used for corks and bungs. "The flowers yield a remedy for hernia, and the Ibdians use the spines of the leaves for fish-hooks." In this country the plant requires a cool stove. A young plant was first brought home by Mrs. Maria Graham, afterwards Lady Calcott.
Pùqa sulphùrba Hort. Hernhauss., Bot. Mag., t. 4696. Although this species is far inferior in point of beauty and of size to the splendid Pùya Altensteinii var. gigantèa, it is nevertheless a handsome-looking plant, and has the merit of flowering in the winter months (in December in the stove at Kew). The native country is unknown. The principal leaves of the plant at Kew spring directly from the root; they are two or three feet long, and gradually taper to a long point upwards, while below they lengthen into a narrow channelled base. From the centre of the plant the peduncle arises, two feet or more in length and leafy below, the leaves like those from the root, but smaller, passing gradually into bracteas, which latter are erect, of a purplish-red, and taper to a slender, rather pungent, green point. The moderately large, pale, sulphur-coloured flowers are protruded much beyond the bracteas, and are sessile.

Quercus infectôma Olivier. This is the Nut-gall Oak, a small evergreen tree from Kurdistan, which it is thought will prove scarcely hardy in this country.

Rhododéndron camellieflòrum J. D. Hooker. This is one of the six new Rhododendrons of Assam and Bhotan discovered by Thomas J. Booth, Esq., and introduced in 1854 by Messrs. E. G. Henderson and Son, all of which have been described in The Magazine of Botany, by Mr. Booth's uncle, Thomas Nuttall, Esq., of Rainhill, the well-known botanist and traveller. This is a somewhat curious species, with pure white flowers, having a faint rosy tinge, and resembling a single Camellia. It was found at Lablung, and also on the Bhotan Alps at an elevation of from 9,000 to 12,000 feet. Dr. Hooker first found this plant, but he did not succeed in sending either seeds or living plants home.
Rhododendron cinnabírinum pállidum. This is an elegant variety of one of the beautiful Sikkim Ilimalaya species, with rosy pink flowers. It is quite hardy.
Rhododendron cítrinum Hasskarl, Bot. Mag. t. 4797. An interesting greenhouse species, with pretty primrosecoloured campanulate flowers. It is a native of Java, where it was found growing at an elevation of from 5000 to 9000 feet.
Reododéndron Kèysi Nutt. Another of the beautiful Rhododendrons discovered by Mr. Booth on the Bhotan Alps. It was found on the northern ridges of the Lablung at an elevation of 10,000 feet, forming low thickets, above the range of \(R\). Hoólceri and \(R\). Falconèri. The habit of the plant is very distinct, and it is quite hardy. The flowers are produced in corymbs below the summit of the branch, each corymb containing five or six flowers. - The other four speries detected by Mr. Booth are: R. Jénkinsi Nutt., a fine species, hardy, or nearly so, somewhat similar to \(R\). Máddeni, growing to the height of six or seven feet, and having, it is believed, yellow flowers ; R. longifollium Nutt., a plant with magnificent leaves, discovered on the slopes of the Oola Mountains, at an elevation of from 6000 to 7000 feet, and likely to prove hardy in this country; \(\boldsymbol{R}\). Nuttállii Booth, a magnificent greenhouse species from Bhotan, with very large white flowers tinted with rose and yellow at the base, and delightfully fragrant, the flowers are indeed larger than those of any other known Fhododendron; and \(R\). Windsori Nutt,, a fine hardy species, having a dwarf habit, and producing its deep crimson-scarlet flowers in large trusses.
Rhododéndron nívedm J. D. Hook., Bot. Mag. t. 4730. This very beautiful species was found by Dr. Honker in the Sikkim Himalaya, at an elevation of from 10,000 to 12,000 feet. It flowered for the first time in this country in the Royal Gardens of Kew, in May, 1853. It forms a small shrub, with moderately large leaves and rather numerous flowers, which are externally of a yellowish lilac, internally of a palish lilac blotched with deeper lilac, and having, at the inner base five deep blood-purple spots. The form of the flower is broadly campanulate.
Rùbus biflòrus Buchanan; R. pedunculosus D. Don, Bot. Mag. t. 4678. This extremely handsome Bramble was received by Messrs. Veitrh and Son from Nepal, and cultivated by them for some time under the name of R. leucodérmis; a name which it might justly claim (from the pure white of the stems of the plant) were it not that a North-west American species had been so designated by Douglas, and the name adopted by Drs. Torrey and Gray in their Flora of North America. The plant is quite hardy, and very ornamental and striking from the tall very white stems and the copious white flowers, which are produced in May and June, and which are succeeded by "the good-sized and well-flavoured orange or rather deep amber-coloured fruit in the early autumn." It would te worth considering, whether this very handsome and agreeable fruit would not be deserving of culcivation for the table.

Sabbàtia stellairis. A beautiful greenhouse herbaceous perennial from the Southern United States, with deep rose-coloured flowers, having a yellowish-green star-shaped eye.
Sálvia iánthina Otto \& Dietr. This very ornamental species has flowers of a dark violet, the calyx and bracts being of the same colour. It is a native of the mountains of Peru, and half-hardy in this country.-S. PORPHYmíntha Dec. is a dwarf species, a native of Mexico and Central America, with erect racemes of brilliant scarlet flowers.
Sandersònia aurantìaca Hook., Bot. Mag. t. 4716. Liliacea. This remarkable plant was discovered on "Field's Hill near D'Urban, and on the Swartkop Hill, near Pietermaritzborg, Natal, flowering on the 15 th of November, 1851," by John Sanderson, Esq.. secretary of the Horticultural Society of Natal, in compliment to whom the genus has been named. The flowers are produced from the axils of the superior leaves; they are large for the size of the plant, sub-globularly campanulate, drooping, and of a deep orange colour. The plant is a tuberous. rooted greenhouse perennial.
Scheeria mexicàna Scemann, Bot. Mag. t. 4743. A splendid plant with large violet flowers, nearly allied to Achimènes. It is a Mexican cool-stove perennial.
Schizinthus vroliceus Hort. A handsome half-hardy annual, with violet-coloured flowers, which has been raised in the French gardens.
Sciadócalyx Warscewíczil Regel, Gésnera Regeliàna Hort., is a magnificent plant from Santa Martha, with a profusion of scarlet and purple flowers.
Scutellìria vileòsa. A rather coarse-leaved soft-wooded stove shrub from the Andes of Peru, with brilliant scarlet flowers.
Semeiándra grandiflora Hook., Bot. Mag. t. 4727. A dwarf shrub, with scarlet flowers about the size of those of a Fachsia, to which genus it is nearly allied.
Senecio pree'cox. This is a tree groundsel from Mexico, the foliage of which is coarse, but its yellow flowers are extremely showy in the spring. It is a greenhouse shrub.
Siphocámpylos Orbigniànus D. C., Bot. Mag. t. 4713. This plant has a peculiarly lax habit, so that the stem has to be supported by a stick, and the branches are quite pendent. It is a native of Bolivia, where it was discovered by D'Orbigny, after whom the species is named. It is a stove perennial, with handsome foliage and good-sized yellowish flowers, tinged on the back or superior side with red, which, however, are not so highly coloured as those of many of the other species.
Siphocímpylos penduliflòvus. A handsome scandent stove perennial from the Caraccas, the flowers of which are white and rose.
Soleya Drummóndir. A pretty, slender, greenhouse evergreen climber from Australia, with bright blue flowers.
Sonerilea margaritàcea. A beautiful little stove perennial from India, with deep green leaves, marked with white oval spots, " as if sown with pearls," and bright rose-coloured flowers. Introduced by Messrs. Veitch and Son.
Sonerila orbiculata Lindl. This is a pretty perennial species from the Neilgherries, also with rose-coloured flowers. It requires a stove.
Sophòra secundiflòra Dec. A shrub with blue flowers and one-seeded legumes, the seeds being as large as a nut, and the colour of coral. It is a native of Texas, and nearly hardy in Europe.
Spire'a grandiflòra Hook., Bot. Mag. t. 4795. A splendid species, introduced by Mr. Fortune, which flowered in England for the first time in May 1854 : the flowers are large and white, resembling those of an Amelänchier, and the shrub appears hardy in the climate of London.

TÁxus Lindleyàna. This species was found growing on the banks of a creek, under the shade of lofty trees, by Mr. W. Murray of San Francisco, when exploring the range of mountains which runs between the coast range and the Rocky Mountains, lat. \(40^{\circ}, 41^{\circ}, \& c\). N. It formed a tree of considerable size, with the trunk measuring fifty inches in circumference at five feet from the ground. The branches were very long and pendulous, and the wood, which is used by the savages for their bows, is extremely elastic. The berry is red, and grows on the under side of the branches. It is exactly like the berry of the Irish Yew, each berry having one seed.
Técoma spectábilis. A very showy cool-stove shrub or small tree from New Grenada, with large, bright-yellow flowers, which are produced in terminal clusters.
Thulópsis boreìls, This is a garden name for some unrecognised and possibly new hardy conifer, which is reported to have come from the north of Jndia. It is in the possession of Mr. Pontey, of Plymouth.
Thulópsis dolabràta sieb. et Zucc. A very beautiful large evergreen tree, indigenous to Japan, the Island of Nipon, \&c., with a thick trunk and verticillate drooping branches. It is doubtful whether it will prove hardy in this country. It is the Platýcladus dolabrata of Spach, and the Thuja dolabrdta of Thunberg.
Thù̀a gigantèa Nutt. A very handsome hardy evergreen tree indigenous to North-West America, along the banks of the Columbia River, and Nootka Sound, and attaining the height of from 60 to \(\mathbf{1 7 0}\) feet. The branches, which resemble some of the more graceful species of Lycopddium, are spreading, with compressed, flattened, erect branchlets. It is the Thija Menzièsii of Douglas, and it has, in addition, as synonymes the names of Thurja Craigiana and Libocedrus decurrens. The species is in the possession of Messrs. Low and Co., of Clapton, and of Messrs. Lawson and Son, of Edinburgh.
Torreya myrística Hook., Bot. Mag. t. 4780. A very ornamental tree, found on the Sierra Nevada, a mountain range in California, by Mr. W. Lobb, the well-known and very successful collector of Messrs. Veitch, of Exeter. Its habit of growth resembles that of the Cephalotáxus; but the fruit is very curious, as it forms a kind of drupe about the size of a walnut, the stone of which contains a kernel enveloped in a ligament resembling that of the nutmeg, and hence the specific name. The plant is called the Californian Nutmeg.
Tovària péndula. A greenhouse annual from Venezuela, with yellowish-white flowers. Of botanical interest chiefly.
Trichocentrum Pinèlit and T. purpúreum. These are two small and rather unimportant stove epiphytes; the first from Demerara, with olive-green flowers, and the second from Rio, with cinnamon-coloured flowers.

Vaccínium ovàtum Pursh; V. prunifolium Hort., Bot. Reg. t. 1354., and Bot. Mag. t. 4732. This very little known species was first discovered by Menzies in North-west America, and afterwards traced by Lewis and Scouler and by Douglas, extending in the Oregon territory from the \(40^{\circ}\) to the \(49^{\circ}\) of latitude. It was introduced by Douglas to the Horticultural Society of London, and is perfectly hardy, and very ornamental. The leaves are glossy and evergreen; and the flowers, though much concealed by the foliage when looked on from above, are of a waxy yellowish-white, delicately tinged with pale pink.
Vallisnèria spirìlis. For a considerable time we only possessed the female plant of the curious and interesting Vallisnèria spiralis; recently, however, the male plant has been obtained. It has sessile flowers. At present it is extremely rare in this country.
Verónica Kermegina. A handsome dark variety of Verónica speciosa, which has been raised by J. Luscombe, Esq.,
of Coombe Royal, Devonshire, and which is being sent out by Messrs. Lucombe, Pince, and Co., of Exeter. The flowers, which are produced in beantiful large spikes, are of a deep purplish-crimson; and the plants blossom when in a young state, which is not often the case with \(V\). speciosa.
Verónica variegàta. A very beautiful hybrid Veronica, raised by J. Anderson, Esq., of Maryfield, Edinburgh' between \(V\). Andersonii and \(V\). salicifolia, and being intermediate between the two parents. It has a compact habit of growth, and small glossy foliage. The flowers are produced in racemes abundantly : on first appearing they are of a clear bright pink, gradually shading off to a pure white, and producing a striking effect. The plant has been brought into notice by Messrs. Veitch and Son.
Viburnum suspénsum Hort. This promises to be a valuable evergreen shrub. It resembles the Laurustinus, and has greenish-white flowers. It has yet to be ascertained whether it will prove hardy in this country.
Viola pedàta Willd. This plant was introduced long ago, but it has been little known: now, however, it is being again brought into notice. It is in the possession of Messrs. Low and Co., of Clapton.

Warrea quadràta. A pretty orchid from Central America. The flowers are large and white, with an involute Gloxinia-like lip, which is deeply bordered with red.

\section*{Weigèla amábilis. See Dierválla amábilis.}

Wbllingtònia gigantèa Lindl. ; Sequoia gigantèa Endl.? The following particulars respecting this beautiful and remarkable tree, are extracted from an interesting account given by Dr. Lindley, in the Gardeners' Chronicle, at the close of 1853, when the plant received from that able botanist the name which it now bears. "The other day," Dr. Lindley observes, "we received from Messrs. Veitch, branches and cones of a most remarkable coniferous tree from California, seeds and a living specimen of which had just been brought them by their excellent collector, Mr. William Lobb, who, we are happy to say, has returned loaded with fine things. Of that tree Mr. Lobb has furnished the following memorandum:- 'This magnificent evergreen tree, from its extraordinary height and large dimensions, may be termed the monarch of the Californian forest. It inhabits a solitary district on the elevated slopes of the Sierra Nevada, near the head waters of the Stanislau and San Antonio rivers, in lat. \(38^{\circ} \mathrm{N}\)., long. \(120^{\circ} 10^{\circ} \mathrm{W}\)., at an elevation of 5000 feet above the level of the sea. From eighty to ninety trees exist, all within the circuit of a mile, and these varying from 250 feet to 310 feet in height, and from 10 to 20 feet in diameter. Their manner of growth is much like the Sequoía (Taxddium) sempervirens: some are solitary; some are in pairs; while some, and not unfrequently, stand three and four together. A tree recently felled measured about 300 feet in length, with a diameter, including the bark, 29 feet 2 inches, at 5 feet from the ground; at 18 feet from the ground it was 14 feet 6 inches through; at 100 feet from the ground, 14 feet: and at 200 feet from the ground, 5 feet 5 inches. The bark is of a pale cinnamon brown, and from 12 to 15 inches in thickness. The brauchlets are round, somewhat pendent, and resembling a cypress or juniper. The leaves are of a pale grass green; those of the young trees are spreading, with a sharp acuminate point. The cones are about \(2 \frac{1}{2}\) inches long, and 2 inches across at the thickest part. The trunk of the tree in question was perfectly solid, from the sap wood to the centre; and, judging from the number of concentric rings, its age has been estimated at 3000 years. The wood is light, soft, and of a reddish colour, like Redwood or Sequoía (Taxodium) sempervirens. Of this vegetable monster 21 feet of the bark, from the lower part of the trunk, have been put in the natural form in San Francisco for exhibition: it there forms a spacious carpeted room, and contains a piano with seats for forty persons. On one occasion 140 children were admitted without inconvenience." An exact representation of this tree, in lithograph, from a drawing made on the spot, has been published by Messrs. Veitch, since the return of Mr. Lobb from his successful mission to California. From an acconnt by Dr. C. F. Winslow, given in the Californian Farmer (a weekly journal published at San Francisco), subsequently to that by Dr. Lindley, from which the above is a quotation, we learn that the dimensions recorded by Mr. Lobb do not give us the full height to which this splendid conifer attains, by more than 100 feet, one specimen having been found measuring 450 feet from its head to its root! This specimen is said to have been 10 feet in diameter at 350 feet from its uptorn root ! We learn further from Dr. Winslow's observations, that the locality in which this gigantic tree is found, seems to be confined to an area of a few acres; and that the soil and atmosphere of the place of growth are singularly humid. But what concerns us most to know is, that this very important acquisition to our hardy conifers is now readily obtainable, those enterprising nurserymen, Messrs. Veitch and Son, having succeeded in raising a large number of fine healthy young plants from the seeds brought home by Mr. Lobb. In the Bon Jardinier for 1855 it is said to be identical with the Sequoîa gigariéa of Endlicher; but a plant growing under that name in the Exeter Nursery appears to be quite distinct.
Whitlàvia grandiflòra. A very beautiful hardy Californian annual, with the habit of Eutoca viscida. Introduced by Messrs. Veitch and Son. The flowers are large and bell-shaped, and of a deep purple.

Xanthorrhee'a hastile \(\boldsymbol{R}\). Br., Bot. Mag. t , 4722. In describing this plant in the Botanical Magazine, Sir William Hooker observes, "The Gum trees, or Grass Gum trees, as they are sometimes called, of Australia, are among the most remarkable vegetable features of the colony. An excellent group of them is represented in Mr. Backhouse's Narrative of a Missionary Journey in New South Wales, in the table at p. I71. That peculiar species, however, is considered to be the X. arbdrea, having an arborescent and branched stem." All the species, probably, yield a resinous gum, which, when strewed on hot coals, emits a fragrant smoke, "smelling like a mixture of balsam of Tolu and benzoin," and now used, we are told, as incense in the Roman Catholic churches of the colony. The "Yellow Resin" is the product of the plant under notice, X. hastile, which is said to have been introduced as long ago as 1803, but soon lost. It was, however, reintroduced from Port Jackson in 1845, through Mr. Kidd, then having the temporary charge of the Botanic Gardon of Sydney. The specimen thus obtained blossomed in the Royal Gardens of Kew in the spring of 1853, while still, it is presumed, comparatively a small plant, the whole height being barely six feet; whereas in its native country the scape of the plant alone attains a height of eighteen or twenty feet, and is used by the natives in making spears (whence the specific name hastile) and fish-gigs, being pointed with the teeth of fish or other animals. The leaves are three feet or more in length; the scape is terminal, solitary, and quite erect, bearing at the apex a dark-brown downy spike (not unlike the head of the greater Reed-mace), consisting of a vast quantity of scaly bracts, which give the colour to the spike; and the flowers are amongst these bracts, and are small and sessile. This plant is the Yellow Resin Tree of White.
